

Better Training for Safer Food

Initiative

Silvia BELLINI Biosecurity During Outbreak Management

This presentation is delivered under contract with the Consumers, Health, Agriculture and Food Executive Agency (http://ec.europa.eu/chafea). The content of this presentation is the sole responsibility of Opera S.u.r.l., the Istituto Zooprofilattico Sperimentale Lombardia e Emilia Romagna and the State Food and Veterinary Service of Latvia and it can in no way be taken to reflect the views of the Consumers, Health, Agriculture and Food Executive Agency or any other body of the European Union. The Consumers, Health, Agriculture and Food Executive Agency or any other body of the European Union will not be responsible under any circumstances for the contents of communication items prepared by the contractors.

Warsaw, 3-5 October 2016

SUMMARY

- > Biosecurity
 - √ Farm level
 - ✓ Within the framework of disease control
- > Risk factors involved in the spread of African swine fever
- Biosecurity in the backyard system

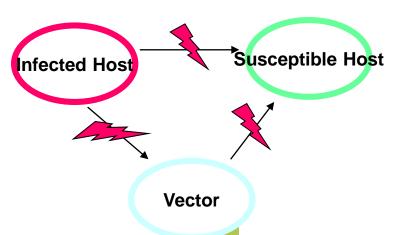

BIOSECURITY (1)

Definition:

"The implementation of measures that reduce the risk (1) of the introduction and (2) spread of disease agents; it requires the adoption of a set of attitudes and behaviours by people to reduce risk in all activities involving domestic, captive/exotic and wild animals and their products" (FAO/OIE/World Bank, 2008 – Good Practices for Biosecurity in the Pig Sector)

Environment

BIOSECURITY (2)

External: measures to adopt to mitigate the risk of introducing a disease in a holding. Measures +/- strict in accordance with:

Type of production, health status required, epidemiological situation.

Internal: measures to adopt to mitigate the spread between different groups of animals, different categories, different units, depends on:

The health status of the holding, structure of the holding, possible margin of improvement on the basis of economic resources available

Bio-Security Levels

Large scale commercial farms

Small scale commercial farms

Backyards

Level of Risk (??)

BIOSECURITY (3)

Also a key element for the control of diseases:

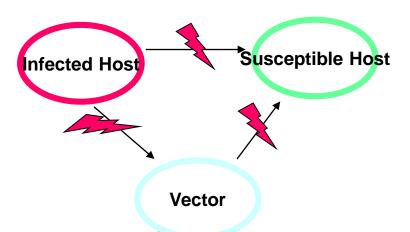

- PREVENTION:
 - Direct: biosecurity
 - Indirect: ...(VACCINATION)
- EARLY DETECTION (surveillance)
- EARLY REACTION (eradication)

To contain successfully the spread of a disease

- 1. To know the disease and its spreding pathways
- 2. Strict implementation of the disease control measures adopted to minimize the risk of spreading

 Environment

Factors affecting the spreading pathways of a disease:

- ✓ Characteristics of the host(s): susceptibility and contagiousness
- ✓ Characteristics of the pathogen: infectivity, virulence and stability
- **✓** Effectiveness of the contact

Strongly Dependent on Population Density

Main Risk Factors for diaseases introduction and spread:

- ✓ Introduction of animals into the holding
- ✓ Introduction of vehicles/means of transport:
 - Animals
 - Runts,...rejected pigs
 - Carcasses
 - Feed
- ✓ Personnel, veterinarians, inseminators and visitors
- ✓ Introduction of equippments
- ✓ Introduction of feed
- ✓ Area: use of common area / pasture (use of manure on agricultural land as fertilizer)
- ✓ Presence of wildlife animals
- ✓ Presence of rodents, birds, insects...
- Introduction of semen
- ✓ Vaccine, water, air...

Population Density

Potential Risk for Introduction/Spread of a disease

Sparsely Populated Livestock Areas (SPLAs): low risk area, local potential risk < 1, it does not allow the spread of the disease.

Densely Populated Livestock Areas (DPLAs): high risk area, local potential spread > 1, population density by itself allows the spread of the disease

To address the farm biosecurity protocol it is necessary to know:

The Holding

Size (?)

Type of production

Management

Infrastructure/limits

Health Status

The Area

Location

Animal density

Health Status

The Situation

- peace time
- emergency

To Identify the Risks

To Apply Proper Control Measures

..and the proper SURVEILLACE

Main Elements of Biosecurity

Segregation:

- ✓ Controlling the entrance of pigs: from outside farms, markets or villages;
- ✓ implementing quarantine for newly purchased animals;
- √ limiting the number of sources of replacement stocks;
- ✓ fencing a farm area and controlling access for people, as well as wildlife, birds, bats, rodents, cats and dogs;
- ✓ maintaining adequate distances between farms;
- ✓ providing footwear and clothing to be worn only on the farm;
- ✓ using an all-in-all-out management system.

Cleaning and Disinfection

- ✓ buildings on the premises, but also vehicles, equipment, clothing and footwear
- Disinfectants

Risk Factors

Biosecurity

in practice is implemented through:

Physical protection measures:

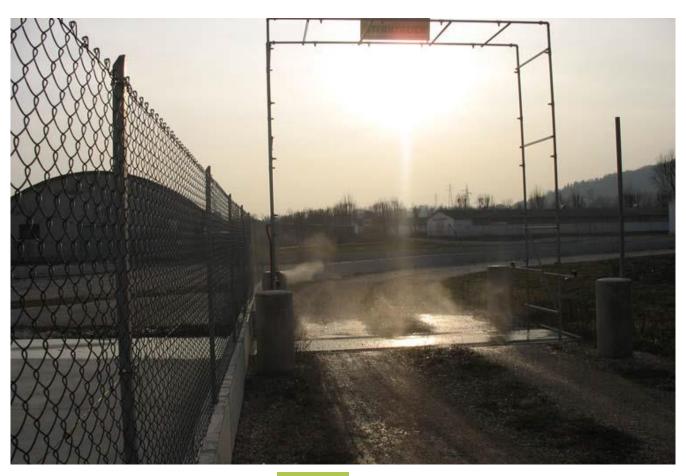

- Enclosing, fencing, roofing, netting
- Cleaning, disinfection and control of insect and rodents

Management measures:

- Procedures for entering and exiting the establishment for animals, products, vehicles and persons
- Procedures for using equipment
- Conditions for movement based on risk involved
- Conditions for introducing animals or products into the establishment
- Quarantine, isolation or separation of newly introduced or sick animals
- A system for safe disposal of dead animals and other animal by-products.

Entrance

YES

Entrance

NO

Biosecurity at farm level

EXTERNAL BIOSECURITY

- Isolation (barriers, fences, gate, signs..)
- Quarantine
- Area for the disinfection of vehicles (Equipment, disinfectants)
- Loading/Unloading area
- Movements management (animals, vehicles, waste, carcasses, feed)
- C&D: people, vehicles, equipment
- Recording of the movements: animals, people, vehicles
- Buying-in Policy
- Partnership
- Training

INTERNAL BIOSECURITY

- Isolation of animals
- Grouping of animals: age, health status...
- Removal of dead animals
- Mannure
- Vaccination (I/E)
- Feeding
- Pocedures for internal control: feed, water..
- Recording: animal testings, diseases, treatments, productions...
- C&D
- Rodents control
- Training

Container for dead pigs

Buying-in Policy

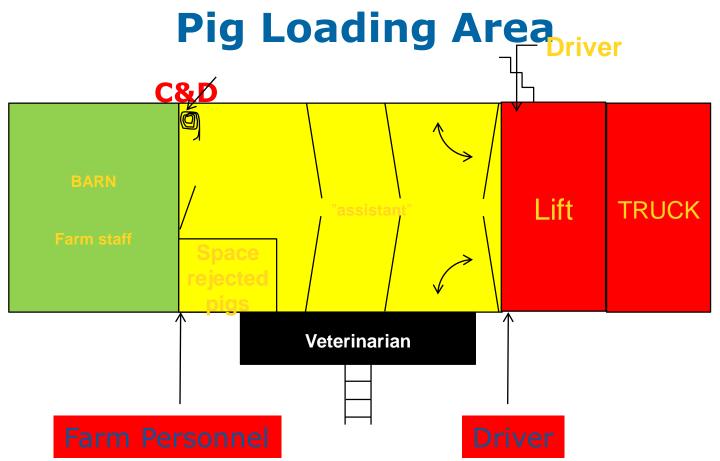

- Careful evaluation of the health status of the supplier(s)
- Low number of supplier(s)
- Transport management
- C&D loading/unloading area
- Quarantine

Quarantine

- 30 days
- Animals in quarantine or phisically isolated from the rest of the heard
- Frequency limited
- Animals frequently checked to early detect the presence of ASF
- Passive surveillance, supplemented when necessary by lab testing

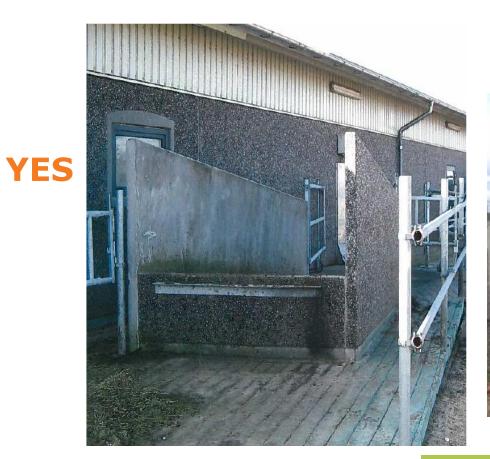

Loading Area

NO

Loading Area

Ramp and Gate

YES

To contain successfully the spread of a disease

- To know the disease and its spreding pathways
- Strict implementation of the disease control measures adopted to minimize the risk of spreading

African Swine Fever:

Spreading Potential:

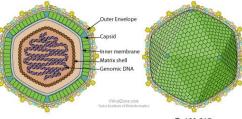

- ASFV is resistant in the environment
- A range of wild and domestic pigs species are susceptible
- ASFV can remain infectious for 3–6 months in uncooked pork products
 - > Chilled meat: at least 15 weeks
 - > Frozen meat: ..years
 - > 3 to 6 months in hams and sausages
- Sometimes soft ticks of the genus Ornithodoros act as biological vector within the vector: trans-stadial, transovarial, and sexual transmission occur

The ASFV: large enveloped DNA virus genus Asfivirus, family Asfaviridae, one serotype but 16 genotypes and different strains of different virulence.

The virus is very stable, and survive in excretion, carcasses, pig meat, pig meat products...

T=189-217

ASFV: resistance to physical and chemical action

Temperature: Highly resistant to low temperatures. Heat inactivated by 56°C/70 minutes; 60°C/20 minutes.

pH: Inactivated by pH < 3.9 or >11.5 in serum-free medium. Serum increases the resistance of the virus, e.g. at pH 13.4 – resistance lasts up to 21 hours without serum, and 7 days with serum.

Chemicals/Disinfectants: Susceptible to ether and chloroform. Inactivated by 8/1000 sodium hydroxide (30 minutes), hypochlorites – 2.3% chlorine (30 minutes), 3/1000 formalin (30 minutes), 3% orthophenylphenol (30 minutes) and iodine compounds.

Survival: Remains *viable for long periods in blood, faeces and tissues*; especially infected, uncooked or undercooked pork products. Can multiply in vectors (*Ornithodoros* sp.).

Possible risk factors for ASF spread

- Introduction of infected pigs in the herd
- Swill feeding with contaminated pork (spread amd mainteinance)
- Wild boar Domestic pigs interface
- Contaminated vehicles, people or feed
- Infected ticks (Ornithodorus genus)

Scientific Opinion on African swine fever (EFSA Journal 2014;12(4):3628)

Table 1: Main sources and routes of transmission established during the outbreaks of ASF in domestic pigs in years 2008-2012

Source and transmission of virus	Number	%
Selling infected pigs	1	0,3
Neighbourhood (infected pigs in backyards)	5	1,7
Direct contact with humans (having a meal right at the farm)	1	0,3
Contact during transportation, shipping, movement	108	38
ASFV infected wild boar	4	1,4
Swill feeding	100	35
Not established	65	23
Total:	284	100

Source: Belyanin, 2013

Preventive Measures to be applied in pig holdings of the Infected Area and in the Infected Area

- Pigs: standstill and movement control (under official control, census, biosecurity to avoid contacts with wild boar, SURVEILLANCE)
- Live pigs markets: when ASF suspected under control (surveillance), closed when confirmed
- Carcasses disposal: all animals (DP, WB) tested and properly disposed (category I, Regulation 1069/2009)
- Swill feeding (prohibition should be ensured, system for gathering waste..)
- Home slaughtering only under veterinary supervision
- Biosecurity (animals, personnel, vehicles, fence, feed, carcasses disposal, equipment..)
- Tick control
- Awareness campaign (Owners, Vets, Hunters...)

Biosecurity in Backyards

(minimum requirements)

- No contact between the pig(s) of the NCF and susceptible animals (indoor keeping)
- No swill feeding / [Treatment (T°: 70°x 30m = negligible risk)]
- No contact to any part of feral pig (hunted or dead wild boar/meat/by-products)
- Unauthorized persons are not allowed to enter the pig holding (stable)
- The owner / person in charge of the pigs, should change clothes on entering the stable and leaving the stable having disinfection at the entrance of holding (stable)
- Presence of effective disinfectants

Measures to minimize the risk of ASF introduction into a pig holding:

- Pigs should be introduced from trusted and certified sources,
- Visitors should be discouraged to enter the pig holdings, specially the commercial ones,
- Personnel should be well trained/informed and contacts with other pigs forbidden,
- Perimeter fencing preventing contact with feral pigs (double fences) should be install on a pig holding,
- Carcasses, discarded parts from slaughtered pigs and food waste should be disposed of in an appropriate manner,
- Mannure
- No part of any feral pig, whether shot or found dead should be brought into a pig holding,
- No swill feeding
- Sharing of equipment between the holdings should be avoided,
- Appropriate means for cleaning and disinfection have to be placed at the entrance of the holdings.
- Vehicles and equipment should be properly cleaned and disinfected before entering into contact with pigs; however they should not enter the holding,
- Appropriate hygiene measures have to she applied by all persons entering into contact with pigs (domestic and/or feral).
