

14-15 September 2022

Assessment of animal diseases caused by bacteria resistant to antimicrobials

**Ad-hoc method of assessment and
groups of animal species covered.**

Standing Committee on Plants, Animals,
Food and Feed

Section Animal Health and Welfare

Trusted science for safe food

1. Global state of play as regards resistant bacterial animal pathogens that cause transmissible animal diseases

ToR1

1. Summarize the situation in the EU and identify the most relevant bacteria in the EU

ToR2

1. Listing and categorisation of the bacteria that are relevant in the EU in the framework of the Animal Health Law

ToR3

EFSA should perform a **literature review** as follows:

- 1. Review AMR-related aspects of any bacteria** responsible for transmissible animal diseases for which **AMR concerns** are described both at EU level and globally
2. Target animal species should include **terrestrial and aquatic food-producing farmed animals**, but also include **companion animals**, as there is a lack of data on AMR in those species
3. Bacteria covered by **Directive 2003/99/EC** should be **excluded**
4. Describe the **occurrence** and **prevalence** of AMR in such bacteria, the most relevant **antibiotics** against which resistance has developed and may also include other aspects (**molecular mechanisms**)
- 5. Uncertainties and data gaps** also identified and described

- 1. Summarize the situation in the EU** in terms of the actual or potential **impact on animal health** of the **most relevant bacteria in the EU**, indicating those for which sufficient data exists and those for which data is not sufficient
- 2. EU relevance** is to be understood on the basis of **practical considerations**, such as actual presence in the EU or presence elsewhere but in animal species, age groups or production systems which are widely used in the EU, or similar elements

EFSA published 8 Scientific Opinion:

<https://storymaps.arcgis.com/collections/8bd9466e00f040ac91769480c70e891e?item=2>

■ Animal (host) species of interest

Cats and dogs

Horses

Swine

Poultry

Cattle

Goat and sheep

Rabbits

Aquatic animals

Chicken, turkey, duck, goose, game birds and ratites

Atlantic salmon, carp, rainbow trout, sea bream, tilapia

- **AMR Bacterial species** causing relevant diseases → excluded if:
 1. rarely cause disease or production losses considering the global situation*
 2. Its presence never or rarely leads to antimicrobial treatment*
 3. never or rarely cause antimicrobial treatment failure due to the existence of acquired antimicrobial resistance*

*as determined by EO

- Additionally, excluded if:
 - Already included in Directive 2003/99/EC
 - Intracellular pathogens (lack of data)
- Initial inclusion of 12-16 pathogens per (main) host
 - Rabbits: 5
 - Aquatic species: 4

- **Antimicrobials considered:** B,C,D AMEG groups (guidelines, EO)
- Collection of data via procurement (Univ. Copenhagen)
- Data sources:
 - Scientific literature (EN): PubMed and Embase (>2010)
 - National AMR monitoring programs (EN, DE)
- Exclusion criteria (17): Main
 - Non-clinical (non-representative: MDR) isolates
 - N<50 (*E. coli*, *S. aureus*), N<10 (others)
 - Raw non-interpreted MIC data

- “Presence in the EU or elsewhere in animal species/age groups/ production systems widely used in the EU”
- **Clinical relevance:** importance of the disease caused by the pathogen/ amount of evidence available (publications/isolates) /geographic distribution
- **Availability of (other) therapeutic options** (number of alternatives in case of AMR) and classification (considering their AMEG category)

Content of scientific opinions

- Results of ELR:
 - Number of publications/AMR results
 - Coverage of National AMR monitoring programs
 - %R per bacteria/study
 - Data gaps/limitations

- Identification of most relevant AMR pathogens

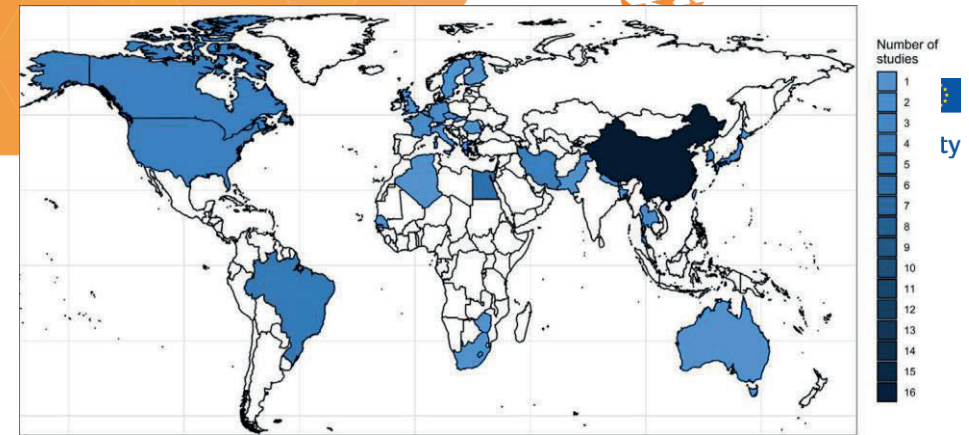

Table 3: Data from last published versions of the national AMR monitoring programmes included in the literature review

Programme	FINRES-Vet	GERM-Vet	RESAPATH	SWEDRES-Svarm	UK-VARSS
Country	Finland	Germany	France	Sweden	United Kingdom
Laboratory method	Broth microdilution	Broth microdilution	Disk diffusion	Broth microdilution	Disk diffusion
AST interpretation	ECOFFs/CBPs	ECOFFs/CBPs	ECOFFs	ECOFFs	CBPs
<i>E. coli</i>	Yes	Yes	Yes	Yes	No
Origin (number of isolates)	Broiler (colibacillosis) 17-27/year	Broilers, young hens and laying hens, turkey (255-473)	Broiler, laying hen, duck, turkey 108-4,262/year	Laying hen 100 (overall)	
Years covered	2016-2019	2014-2018	2014-2018	2017-2018	
<i>S. aureus</i>	Yes	Yes	Yes	No	Yes
Origin (number of isolates)	Broiler (tenosynovitis) 8-26/year	Broilers, young and laying hens, turkeys	Laying hen and broiler 144-457/year		Chicken 26-33 (overall)
Years covered	2016-2019	2014-2018	2014-2018		2015-2019
<i>E. cecorum</i>	No	No	Yes	No	No
Origin (number of isolates)			Laying hen and broiler 124-445/year		
Years covered			2014-2018		

Assessment: Evidence available

- Not always related with clinical relevance (methodological challenges)

Assessment

(n=6)

Atlantic salmon

Carp

Rainbow trout

Sea bream

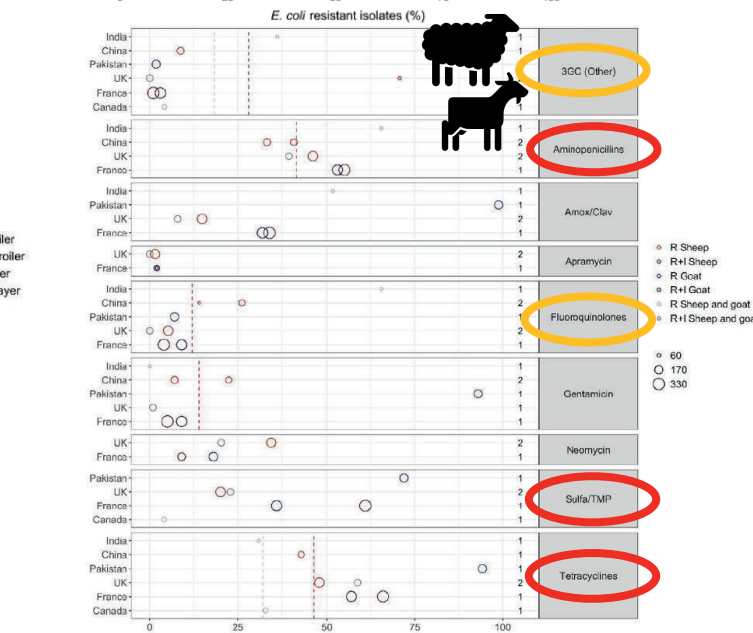

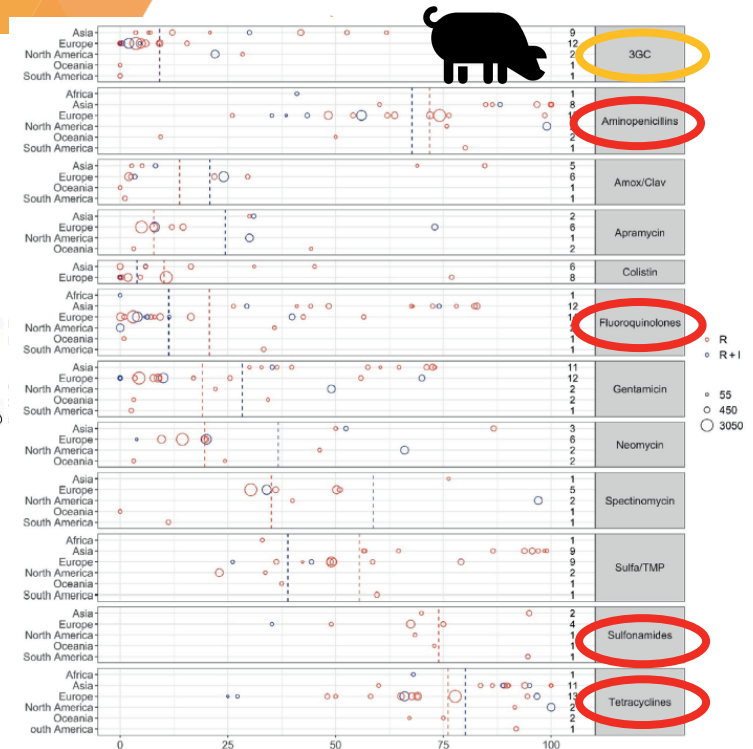

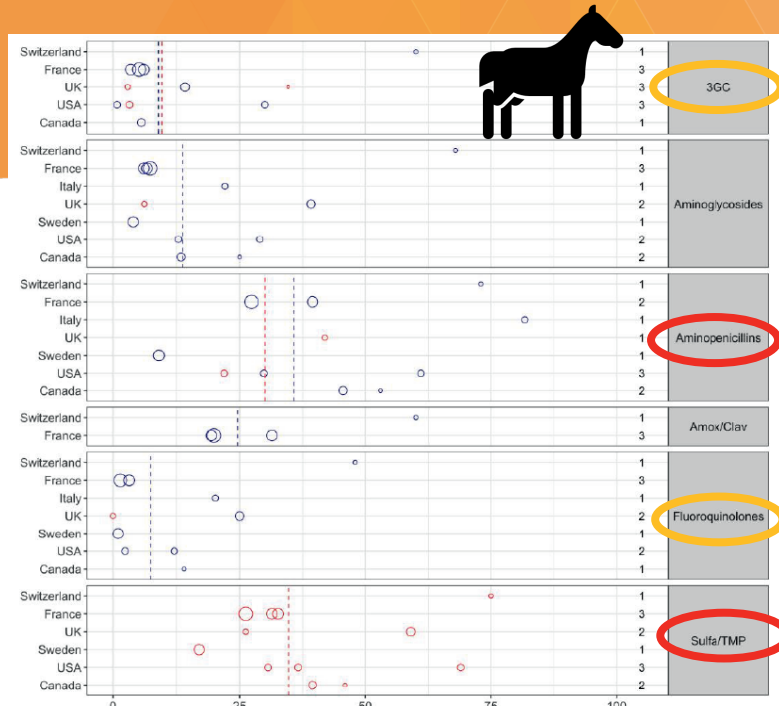

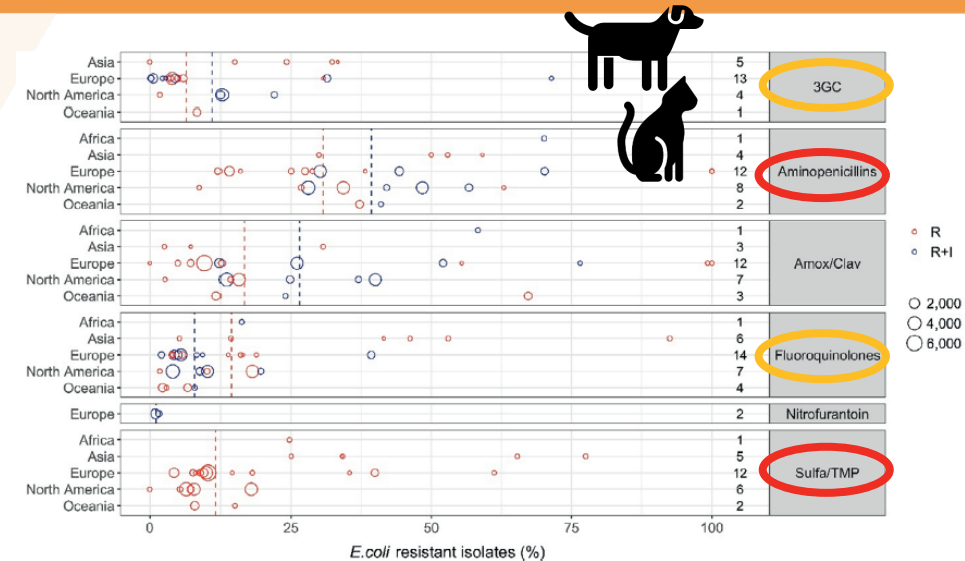

Tilapia

- Ampicillin
- Enrofloxacin
- Florfenicol
- Flumequine
- Oxolinic acid
- Sulfo-trimethoprim
- Oxytetracycline

E. coli: its own thing

- Most problems applicable to all animal species (to a different degree)
 - lack of standardized methodology/breakpoints/definitions (especially in certain cases)
 - Heterogeneity in the (sometimes very scarce) information available (infected vs. subclinical vs. clinically affected animals, treatments...)
 - National monitoring programs can be of great use (but need to be harmonized)
 - Absence of evidence (of AMR in a given pathogen) is certainly not evidence of absence in certain cases (e.g., *Mycoplasma*, *Brachyspira*)
 - Treatment failure may not be related with microbiological AMR (e.g., *E. cecorum* in poultry) and microbiological AMR may not necessarily lead to treatment failure (e.g. *P. aeruginosa* in dogs)
