

18 NOVEMBER 2024

# SCIENTIFIC REPORT ON RISK FACTORS FOR AFRICAN SWINE FEVER

Lina Mur

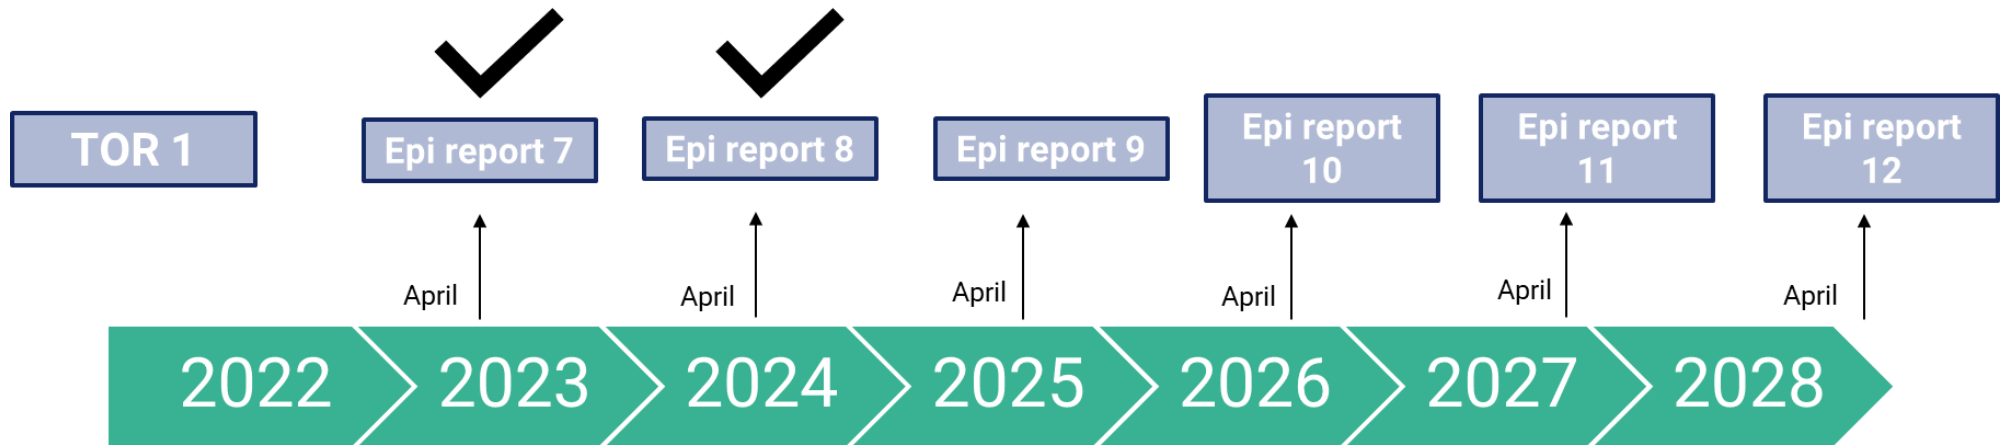

Scientific Officer

Animal Health team, BIOHAW unit

# MANDATE ON ASF (2022-2028)

Epidemiological reports

Risk factor reports

---

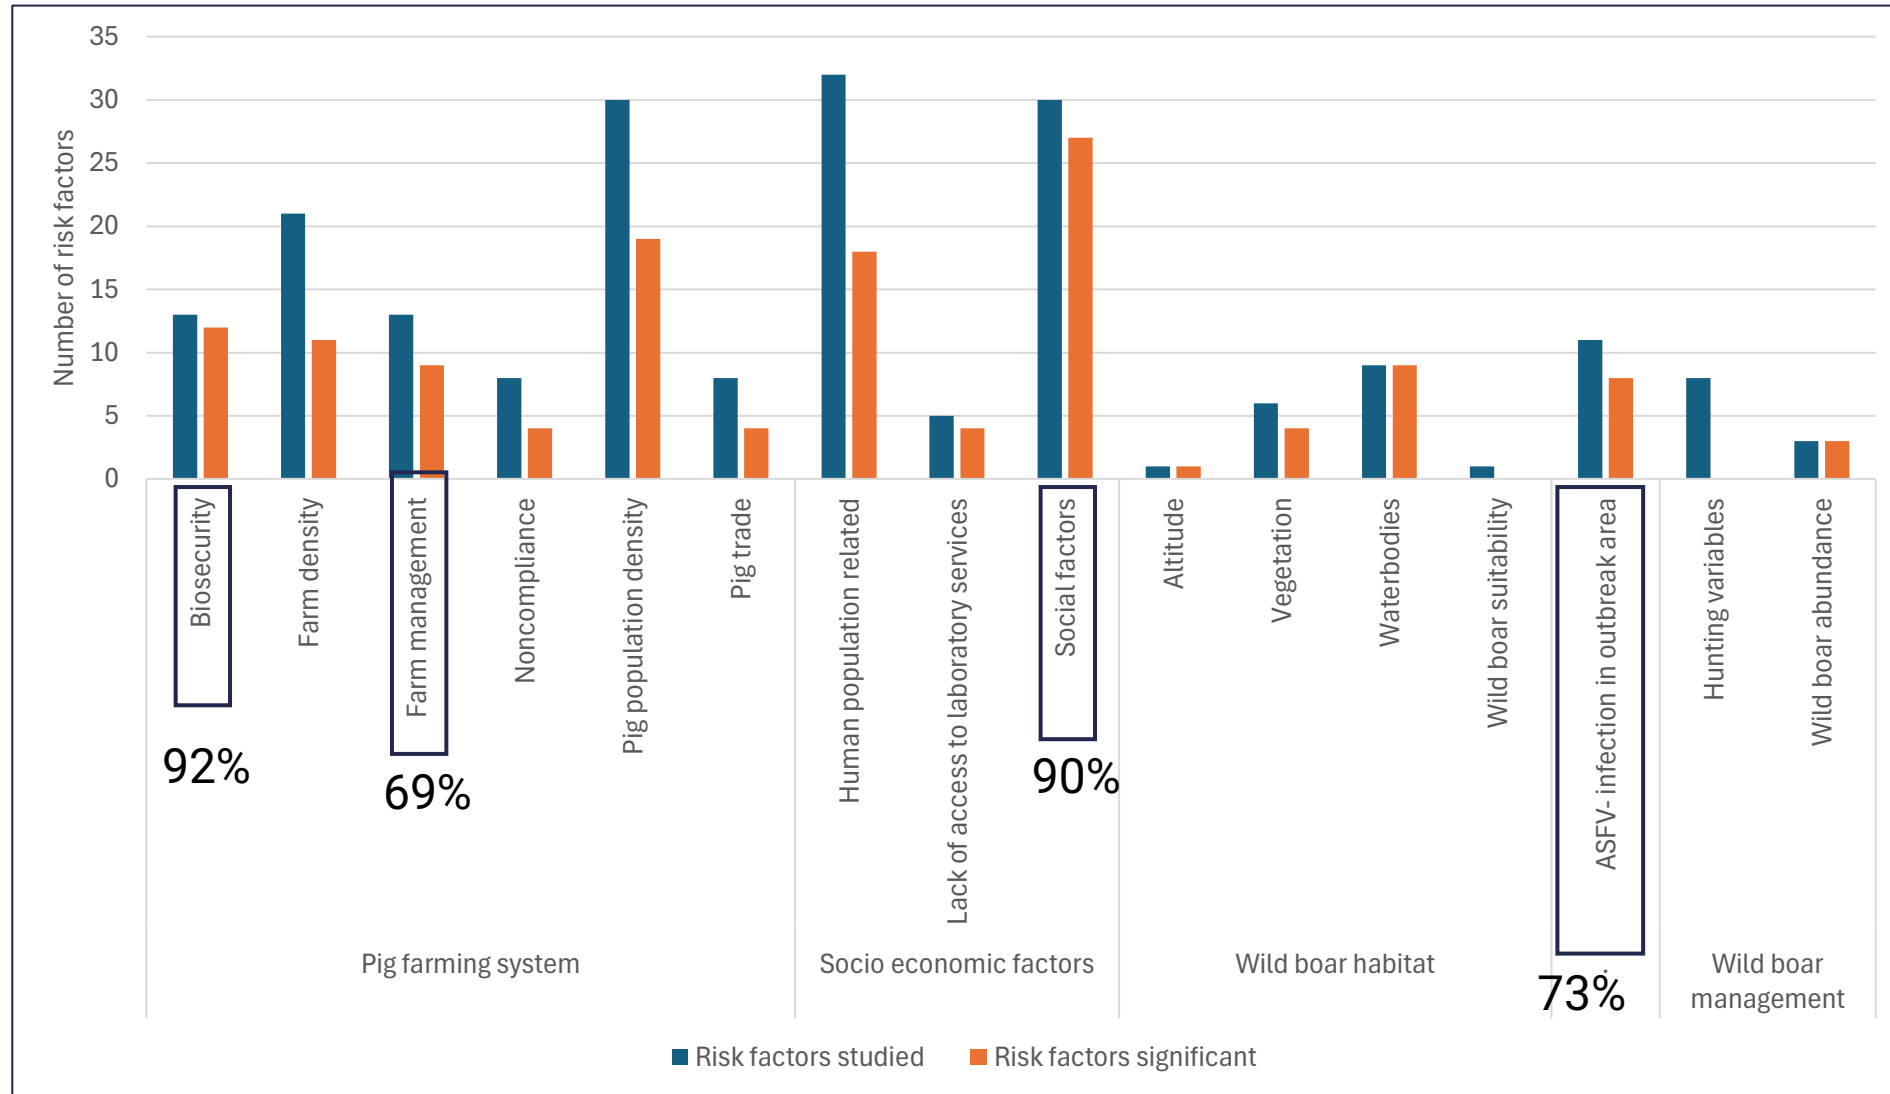

# MANDATE ELEMENTS

- I. Risk and protective factors of ASF in **domestic pigs**.
- II. Risk and protective factors in **wild boar populations**.
- III. **Role of vectors** (including mechanical).
  
- IV. Effectiveness of **barriers for controlling wild boar movements**.
- V. **Immunocontraception** as a method for controlling wild boar populations.

**It is not a prioritization exercise**

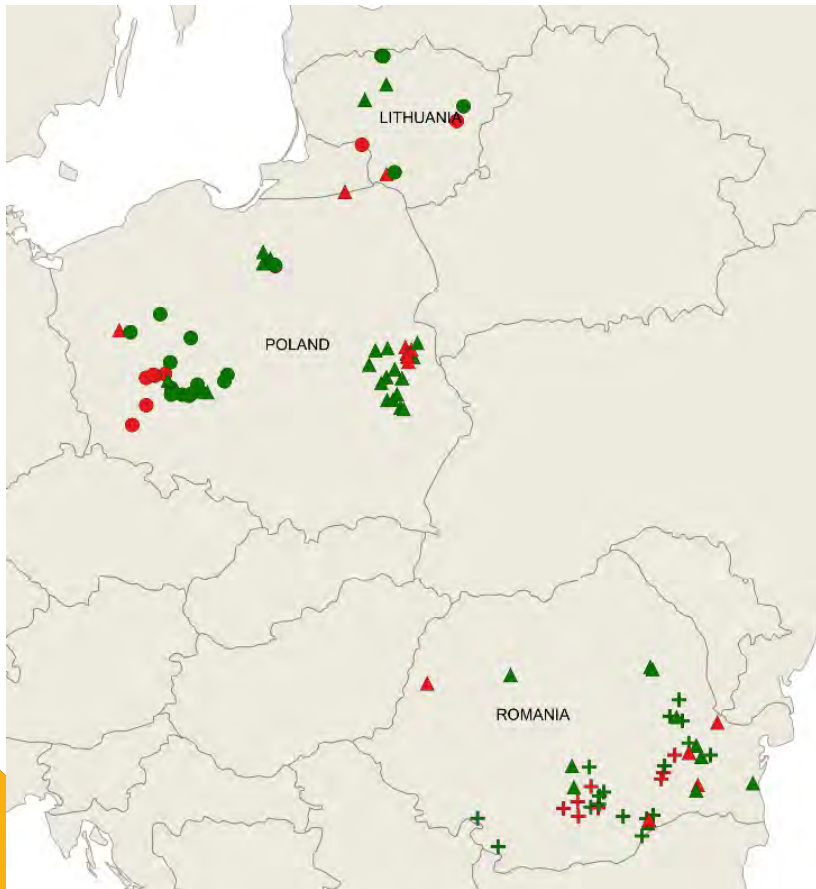

# 1. RISK AND PROTECTIVE FACTORS IN DOMESTIC PIGS

# 1. RISK AND PROTECTIVE FACTORS IN DOMESTIC PIGS

## Case control study in commercial farms

### Legend

- Case farms
- Control farms
- + 2021
- O 2022
- Δ 2023

## Results

	Variable	OR	95% CI
<b>Protective</b>	Distance to the closest ASF outbreak in domestic pigs	0.09	0.02 - 0.4
	Use of insect nets on all windows and air intake	0.22	0.05 - 0.99
<b>Risk</b>	Manure from other holdings spread within 500 m from the farm	6.72	1.34 - 33.83
	Presence of bedding material	8.65	1.35 - 55.53

# 1. RISK AND PROTECTIVE FACTORS IN DOMESTIC PIGS

## Conclusion

- Risk factors for domestic pigs:
  - Biosecurity and social factors
  - Farm management:
    - spread of manure around farms, bedding materials, use of insect nets
  - Close proximity to ASF-outbreaks

## Recommendations

- Strict biosecurity measures
  - Safe storage of bedding material
  - Especially where ASF present
- Insect screens as an additional protection where ASF is present in the surroundings.

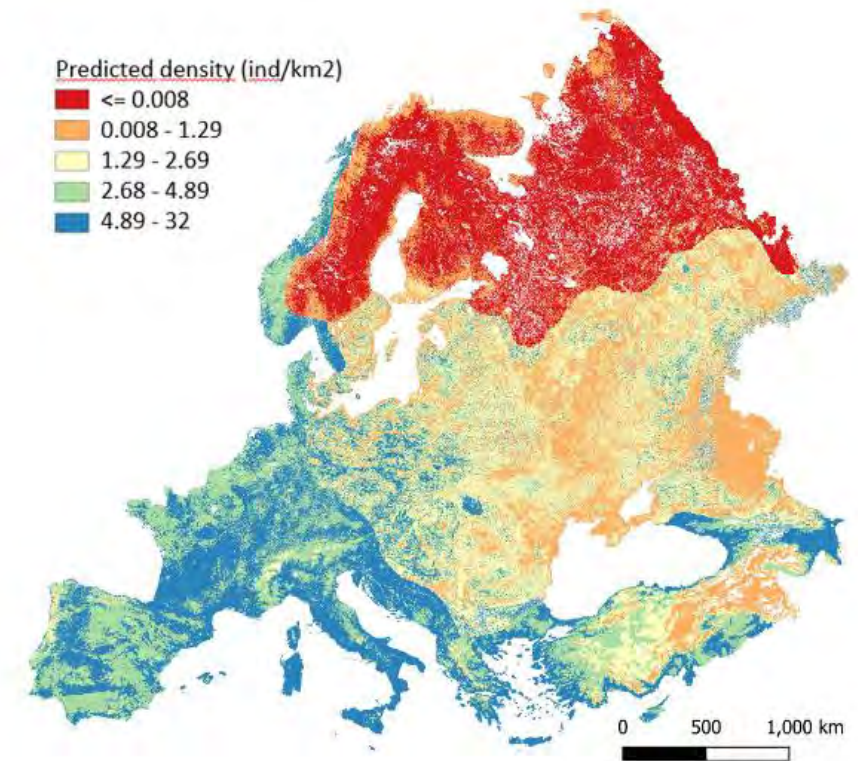

## 2. RISK AND PROTECTIVE FACTORS IN WILD BOAR

1. Update of the Systematic **Literature** Review
2. Risk factors for **occurrence**
3. Risk factors for **persistence**
4. Risk factors for **spread**  
→ Transmission model in IT

Spatial statistical  
models  
LV, LT (IT, SE)

Wild boar density data 2x2km

# 2. RISK AND PROTECTIVE FACTORS IN WILD BOAR

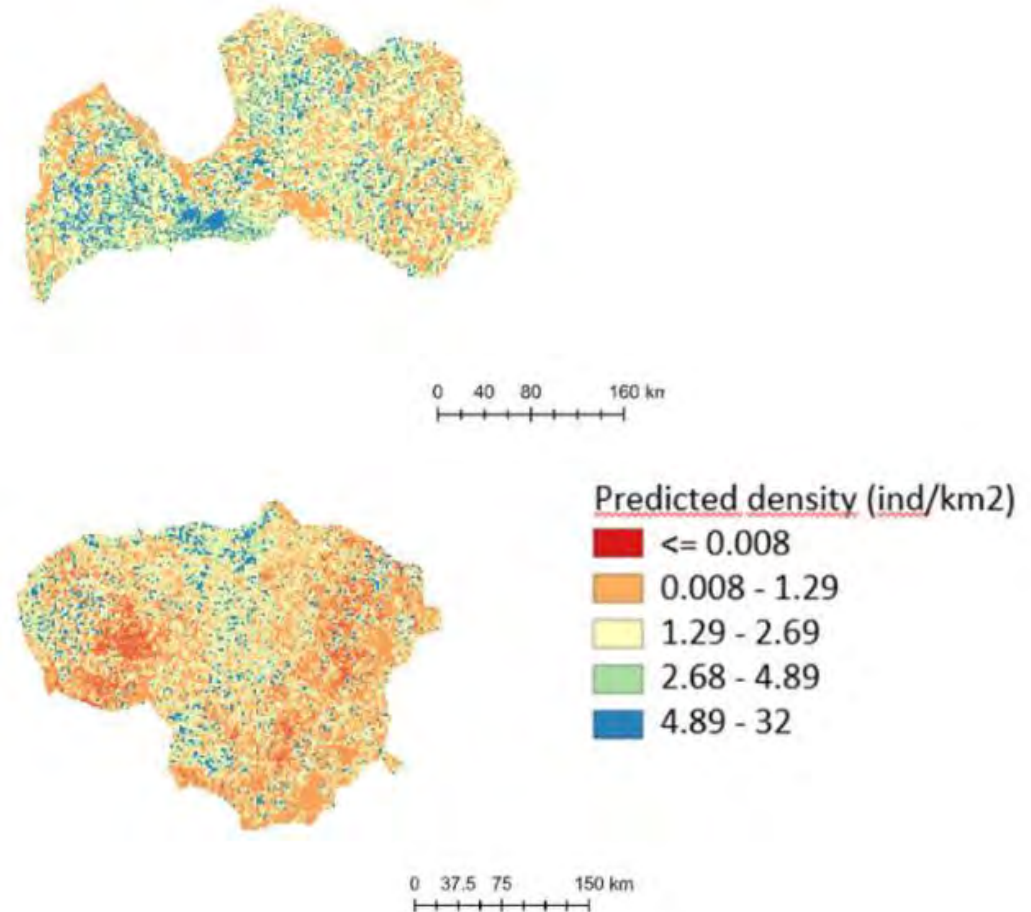

## 2. RISK AND PROTECTIVE FACTORS IN WILD BOAR

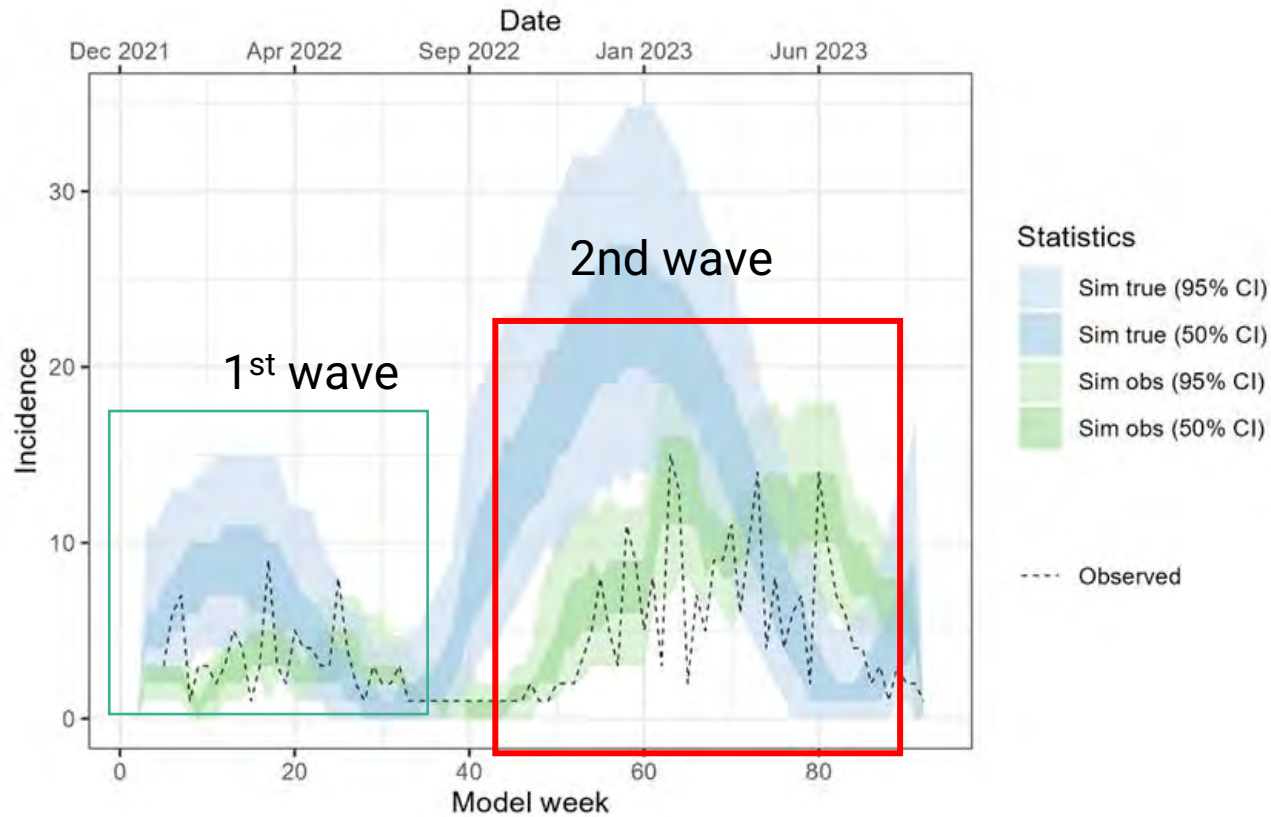

### Wild boar predicted density in Latvia and Lithuania

	Occurrence	Persistence
Climatic factors	++	++
Forest indicators	++	++
Potential barriers	-	++
Wild boar density	+	-
Scenarios analysed	Latvia Lithuania (96%) +Sweden, Italy	Latvia and Lithuania

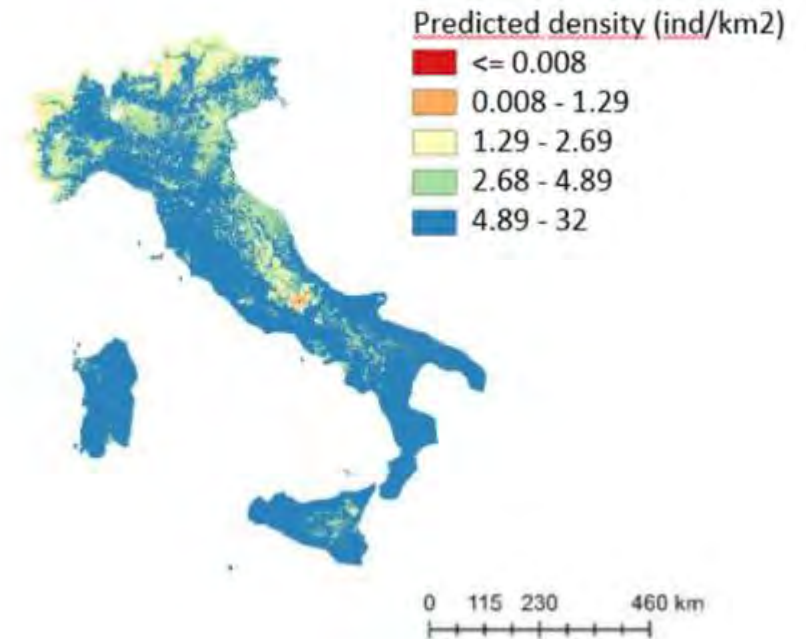

# 2. RISK AND PROTECTIVE FACTORS IN WILD BOAR

## SPREAD in Northern Italy

## Wild boar predicted density in Italy

## 2. RISK AND PROTECTIVE FACTORS IN WILD BOAR

### Conclusions

- Wild boar density significant in literature review and historically
- No clear effect and consistent effect on ASF in selected scenarios:
  - Moderate effect in occurrence
  - Wave-specific effect in Italy only during the second wave
- Other factors: habitat, climate and potential barriers (population continuity)

### Recommendations

- Further studies: same methodologies in different context
- Field data in a harmonised way
- Better wild boar density estimates

# 3A. ROLE OF **BIOLOGICAL VECTORS** ON ASF IN EUROPE

*Ornithodoros erraticus* is the only known biological vector in Europe

Species	Identified hosts	Habitat
<i>O. capensis</i>	Birds	Sea birds' nets and burrows
<i>O. coniceps</i>		Nests, cliffs, wells, caves, ravines, stables
<i>O. maritimus</i>		Bird nests in vegetated, rocky, coasts and cliffs
<i>O. lahorensis</i>	Sheep, camels, cattle, goats, horses, donkeys, dogs, rabbits	Stables and animal houses, in bricks and stones
<i>O. alactagalis</i>	rodents, badgers, foxes, hedgehogs and lizards	Moist burrows
<i>O. tholozani</i>	Sheep, goats, porcupines, hedgehogs, badger, camels, rodents and cattle	Crevices in caves and ruins. Animal shelters and burrows
<i>O. verrucosus</i>	Rodents (ground squirrels, marmots and hamsters)	Cliffs, burrows, nest and caves
<i>O. erraticus complex</i>	<b>Pigs</b> , cattle, rabbits, humans and sheep	Holes, cracks, burrows, bird nests, walls of pig pens

**Habitat *O. verrucosus* (Ukraine)**

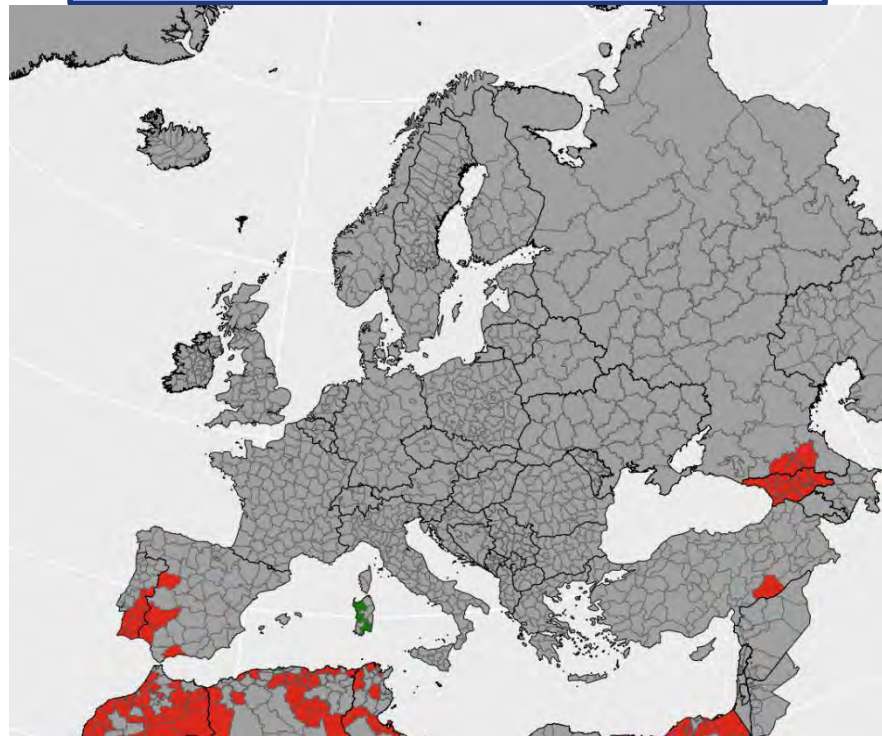

Courtesy of S.Filatov

# 3A. ROLE OF **BIOLOGICAL VECTORS** ON ASF IN EUROPE

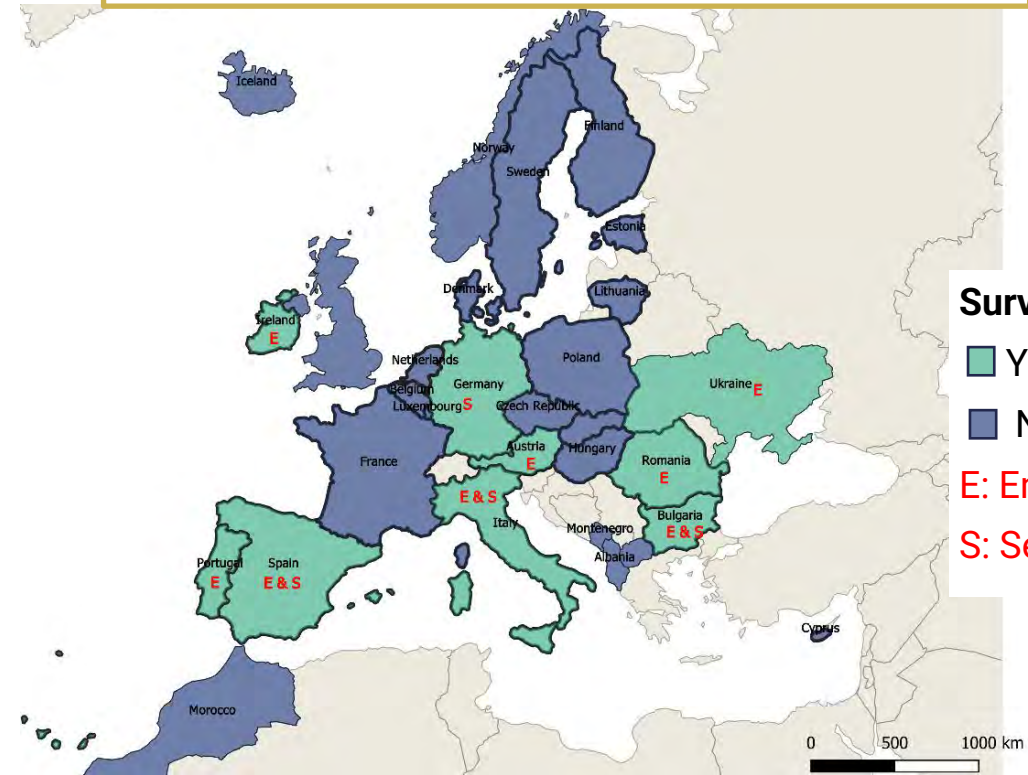

Confirmed presence of *O. erraticus*

## Distribution status

- Presence
- Absence
- No data

Surveillance of *Ornithodoros* spp in Europe

## Surveillance

- Yes
- No
- E: Entomological
- S: Serological

*Ornithodoros erraticus* played no role in the EU in the last 10 years

# 3A. ROLE OF MECHANICAL VECTORS ON ASF IN EUROPE

	Survival ASFV (or DNA) in the arthropod	Transmission to pigs	Detection ASFV DNA near outbreaks
<b>Stable flies (Stomoxys calcitrans)</b>	++	+	+++++
<b>Horse flies (tabanids)</b>	+?	?	++
<b>Mosquitoes (Culicidae)</b>	+	?	+
<b>Midges (Culicoides)</b>	?	?	+

## Conclusions

- Stable and horse flies are exposed to ASFV in the field
- They could potentially serve as mechanical vectors of ASFV
- Uncertainty on how often this might occur

## Recommendations

- Field evidence is needed
- Insect nets

# 4. BARRIERS FOR CONTROLLING WILD BOAR MOVEMENT

SYSTEMATIC LITERATURE REVIEW

27 publications

QUESTIONNAIRE

69 px  
17 countries

FIELD EXPERIENCES  
FENCES-ASF

7 MS

## FENCES

### Focal fencing

Belgium

Licoppe et al., 2023

### Wave-front fencing

Credits: Maja Hitij/Staff/Getty Images Europe

## RIVERS

## ODOR REPELLENTS

Faltusova et al., 2024

## 4. BARRIERS FOR CONTROLLING WILD BOAR MOVEMENT

### Conclusions

- Fences combined with culling and carcass removal can be efficient if:
  - Adequate design, spatial coverage, timely implemented
  - Adaptable to ASFV spread
  - Regular maintenance (electric, more)
- In focal introductions and wave-like fronts

### Recommendations

- Local epidemiological context is essential for designing fencing system
- Odour repellents alone not recommended

# 5. IMMUNOCONTRACEPTION FOR CONTROLLING WILD BOAR POPULATIONS

## Gonadotrophin Releasing Hormone (GnRH)

- Injectable vaccine → successful in experimental & field
- 1 experiment on oral formulation on pigs

### Conclusions

- GnRH vaccines have a potential as a complementary tool
- Oral vaccine require substantial additional work

### Recommendations

- More research for safe, efficient oral vaccine
- long term implications: environment, legislation, social acceptance

System to deliver baits to wild pigs

Campbell et al.2011

# CONCLUSIONS

- **Biosecurity and farm management:** essential to control ASF in domestic pigs
- **Wild boar density:** relevant but not clear/constant effect
- *O. erraticus* did not play a role in the EU in last 10 years
- **Mechanical vectors** could potentially transmit ASFV but extent unknown
- **Fences** can contribute to control, including in wave-front scenarios
- **Immunocontraception** has potential, but still important work missing

**Importance of data collection, monitoring and reporting** to keep on building knowledge
