4.2. BSE positive cases.....	16
4.3. Testing by target group.....	22
4.4. Age distribution of BSE positive cases .....	28
4.5. Year of birth distribution of BSE positive cases detected since 2001 .....	32
4.6. Prevalence of BSE in different age categories in 2010.....	34
4.7. BSE in young animals .....	42
5. SUMMARY OF TSE TESTING IN OVINE AND CAPRINE ANIMALS DURING 2010.....	44
5.1. Sampling .....	44
5.2. Positive cases .....	46
5.3. Atypical cases.....	58
5.4. TSE discriminatory tests .....	61
5.5. Age distribution of TSE positive cases in ovine animals .....	62
5.6. Genotyping .....	65

## **LIST OF ACRONYMS**

<b>AM :</b>	Ante-mortem inspection
<b>BSE :</b>	Bovine spongiform encephalopathy
<b>CWD:</b>	Chronic wasting disease
<b>DNA :</b>	Deoxyribonucleic acid
<b>EU 15 :</b>	The 15 countries that were members of the European Union before 1 May 2004
<b>EU 15(-UK) :</b>	The EU 15 except the United Kingdom
<b>EU 12</b>	The 12 countries that joined the European Union since 1 May 2004
<b>EU 27 :</b>	EU 15 + EU 12
<b>EU 27(-UK) :</b>	The EU 27 except the United Kingdom
<b>EU 27(-CY)</b>	The EU 27 except Cyprus
<b>Na:</b>	not available
<b>NSP :</b>	National scrapie plan
<b>TSE:</b>	Transmissible spongiform encephalopathy
<b>TSE Regulation:</b>	Regulation (EC) No 999/2001

## **1. SUMMARY**

### **1.1. Bovine animals**

In 2010, a total of 7 504 787 bovine animals were tested in the EU 27 in the framework of the BSE monitoring programmes. 45 bovine animals turned out positive.

1 173 069 risk bovine animals and 6 330 680 healthy animals slaughtered for human consumption were tested by rapid tests. 378 animals were tested in the framework of culling of animals with an epidemiological connection to a BSE case. In addition, 660 bovine animals were tested in the framework of passive surveillance (animals reported as official BSE suspects. 100 % of positive cases were detected by the active monitoring (testing of risk animals, healthy slaughtered and culled cattle) and 0 % were detected by passive surveillance.

No BSE cases were found in Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, Germany, Greece, Hungary, Italy, Latvia, Lithuania, Luxembourg, Malta, Romania, Slovenia and Sweden. The number of BSE cases and the overall prevalence in tested animals decreased by respectively 33 % and 33 % in 2010 compared to 2009.

### **1.2. Ovine and caprine animals**

In 2010, a total of 344 211 ovine and 142 668 caprine animals were tested in the EU 27 in the framework of the TSE monitoring programmes. 1112 ovine and 435 caprine animals turned out positive.

343 452 ovine animals were tested by active monitoring, while 759 were animals reported as official TSE suspects and therefore subjected to laboratory examination. In caprine animals, the numbers of tests in the respective groups were 141 558 (active monitoring) and 1 110 (TSE suspects). Some 436 and 52 TSE cases in respectively sheep and goats confirmed in 2010 were subjected to discriminatory testing. None of them have been confirmed to be BSE.

All Member States submitted information on the the TSE testing of bovine, ovine and caprine animals. In addition to the Member States, Norway also submitted information on their TSE testing programmes.

## **2. MONITORING PROGRAMMES, SAMPLING AND DIAGNOSTIC METHODS APPLICABLE IN 2010**

### **2.1. Legal basis**

Animals suspected of a TSE shall be examined in accordance with Article 12.2 of Regulation (EC) No 999/2001 of the European Parliament and of the Council laying down rules for the prevention, control and eradication of certain transmissible spongiform encephalopathies as amended (TSE Regulation). The legal framework for the active monitoring of ruminants for the presence of TSE is laid down in Article 6 of TSE Regulation and specified in its Annex III Chapter A.

The EU-15 Member States and Slovenia were authorised in 2009 to apply a revised BSE monitoring programme with an increased age limit for BSE testing as a result of Decision 2009/179/EC.. Cyprus was added to the list of authorised Member States on February 5, 2010 by Decision 2010/66/EC amending Decision 2009/719/EC, and actually stopped testing healthy cattle between 30 and 48 months of age at the slaughterhouse as of March 1, 2010.

The legal basis for the sample collection and for the test methods is laid down in Chapter C of Annex X to TSE Regulation. From 2005, Annex X (as amended by Commission Regulation (EC) No 36/2005) also provides for mandatory discriminatory testing for BSE of TSE cases detected in small ruminants.

The legal basis for the testing for the determination of the prion protein genotypes is laid down in points 8.1 and 8.2 of Chapter A in Annex III to TSE Regulation.

The EU legislation on TSE monitoring is summarised in Table 1.

### **2.2. BSE monitoring of bovine animals**

The monitoring of bovine animals for the presence of BSE is divided into the following target groups:

#### **(1) Fallen Stock**

Bovine animals which have died or have been killed on the farm or in transport, but not slaughtered for human consumption nor killed in the framework of an epidemic. Member States may decide to derogate from this provision in remote areas with a low animal density, where no collection of dead animals is organised. The derogation shall not cover more than 10% of the bovine population in the Member State.

#### **(2) Emergency slaughtered animals**

Bovine animals subject to "special emergency slaughtering" as described in relevant Community legislation.

### **(3) Animals with clinical signs at AM**

Bovine animals sent for normal slaughter but the slaughter of which was deferred because they were:

- (a) suspected of suffering from a disease which is communicable to humans and to animals or showing symptoms or being in a general condition such as to indicate that such a disease may occur.
- (b) showing symptoms of a disease or of a disorder of their general conditions which is likely to make their meat unfit for human consumption.

### **(4) Healthy slaughtered animals**

Bovine animals subject to normal slaughter for human consumption and animals without clinical signs of disease slaughtered in the context of a disease eradication campaign other than BSE.

### **(5) Animals culled under BSE eradication**

Birth cohorts (bovine animals born in a herd within 1 year before or after the birth of a BSE case), rearing cohorts (bovine animals reared together with a BSE case during the first year of their life), offspring and any other bovine animals killed because of an epidemiological link to a BSE case.

### **(6) Animals clinically suspected of being infected by BSE**

Bovine animals reported as suspect of TSE as defined in Article 3 of the TSE Regulation and subject to the measures described in Articles 12 and 13.

## **2.3. TSE monitoring of ovine and caprine animals**

The testing of ovine and caprine animals for the presence of TSE is divided into the following target groups:

### **(7) Healthy animals which are slaughtered for human consumption**

Member States with major ovine population shall test an annual minimum sample size of healthy slaughtered animals over 18 months of age.

Where a Member State experiences difficulty in collecting sufficient numbers of healthy slaughtered animals to reach its allotted minimum sample size, it may choose to replace a maximum of 50% of its minimum sample size by testing dead animals at the ratio of one to one and in addition to the minimum sample size set out for dead animals.

### **(8) Animals which are not slaughtered for human consumption**

This target group contains almost exclusively fallen stock, with a few emergency slaughtered animals and animals with clinical signs at AM which have died or been killed, but which were not killed in the framework of an

epidemic or slaughtered for human consumption. There are minimum samples sizes of both ovine and caprine animals over 18 months of age.

#### **(9) Animals culled under TSE eradication**

Including animals additionally tested on infected herds before culling measures were applied.

#### **(10) Animals clinically suspected of being infected by a TSE**

Ovine and caprine animals reported as suspect of TSE as defined in Article 3 of the TSE Regulation and subject to the measures described in Articles 12 and 13.

### **2.4. Sampling and testing for TSE monitoring**

Samples collected in the context of TSE active monitoring are screened by one of the rapid tests listed in Annex X to the TSE Regulation. Confirmation tests from inconclusive or positive results in the active monitoring and analysis of samples from suspects are performed by histopathology, immunocytochemistry, immunoblotting or by demonstration of characteristic fibrils by electron microscopy.

Further discrimination between BSE and scrapie has become mandatory from January 2005 on by Commission Regulation (EC) No 36/2005. To this purpose the discriminatory immunoblottings, immunocytochemistry and enzyme linked immunosorbent assay were laid down in Chapter C point 3.2.(c) of Annex X to TSE Regulation. In addition the mouse bio-assay method has to be applied to certain samples for final confirmation or exclusion of BSE.

### **2.5. Sampling and testing for the prion protein genotype determination in ovine animals**

The prion protein genotype shall be determined for:

- (1) All TSE positive ovine animals.
- (2) A random sample of ovine animals selected from animals over 18 months of age.

The alleles were defined by reference to the amino acids encoded by codons 136, 141, 154 and 171 of the prion protein gene. Routine methods for the collection of samples and DNA genotyping are used.

**Table 1: Summary of the EU legislation on TSE monitoring in 2010**

<b>EU 27</b>	
<b>Legal provisions</b>	Regulation (EC) No 999/2001 as amended Commission Decision 2007/182/EC as amended Commission Decision 2009/719/EC as amended
<b>Bovine animals</b>	
<b>Special emergency slaughter</b>	For EU-15 + Slovenia + Cyprus*: all > 48 months
<b>Clinical signs at AM</b>	For other MS : all > 24 months
<b>Fallen stock</b>	
<b>Animals slaughtered for human consumption</b>	For EU-15 + Slovenia + Cyprus*: all > 48 months For other MS : all > 30 months
<b>BSE suspects</b>	All
<b>Ovine and caprine animals</b>	
<b>Animals slaughtered for human consumption</b>	Minimal annual sample size of animals over 18 months of age in MS with major populations
<b>Animals not slaughtered for human consumption</b>	Minimal annual sample size of animals over 18 months of age depending on size of MS populations of ewes or goats
<b>Animals in infected flocks</b>	Minimal sample size in animals over 18 months of age
<b>Other than bovine, ovine and caprine animals: voluntary</b>	

\* as from March 1, 2010

### **3. ANNUAL AND MONTHLY REPORTS**

In accordance with Article 6.4 and as specified in Chapter B.I of Annex III to TSE Regulation, Member States shall submit an annual report to the Commission on the monitoring programme performed and the outcome of it.

All this information has been electronically submitted by the Member States, and introduced and processed by the Commission in a database in order to summarise the information provided and to elaborate summary tables to be distributed within the Commission and to the Member States and Norway. The data contained in the present report only refer to the test results obtained from samples taken from 1<sup>st</sup> January 2010 to 31<sup>st</sup> December 2010. However, as certain Member States may calculate their annual statistics using other reporting criteria (i.e. based on the date of final test results rather than the date of sampling), the data in this report may slightly differ from the national figures published by the Member States for 2010. The present report should be considered as a final update of the information received and as the Commission summary report for 2010 as requested by Article 6.4 of the TSE Regulation.

The target groups mentioned in this report were divided into the following categories:

#### **(1) Bovine animals:**

##### **(a) Active Monitoring**

- Fallen stock
- Emergency slaughter
- Animals with clinical signs at AM
- Healthy slaughtered animals
- Animals culled in connection to a BSE case.

Fallen stock, emergency slaughtered animals and animals with clinical signs at ante-mortem inspection are considered as "**risk animals**".

##### **(b) Passive surveillance**

Animals reported as official BSE suspects by the farmer or the veterinary practitioner and subject to laboratory examination.

The age limits used in testing different target groups of bovine animals are summarised in Table 2.

#### **(2) Ovine and caprine animals**

##### **(a) Active Monitoring**

- Animals not slaughtered for human consumption: risk animals containing almost exclusively fallen stock with a few tests in

emergency slaughtered animals and animals with clinical signs at AM.

- Healthy animals slaughtered for human consumption
- Animals culled in a herd where an animal has been declared TSE positive including animals additionally tested on infected herds before culling measures were applied.

(b) Passive Surveillance

- Animals reported as official TSE suspects by the farmer or the veterinary practitioner and subject to laboratory examination.

In addition, results of the monthly reports of Norway (NO) are included.

## **4. SUMMARY OF THE BSE TESTING IN BOVINE ANIMALS DURING 2010**

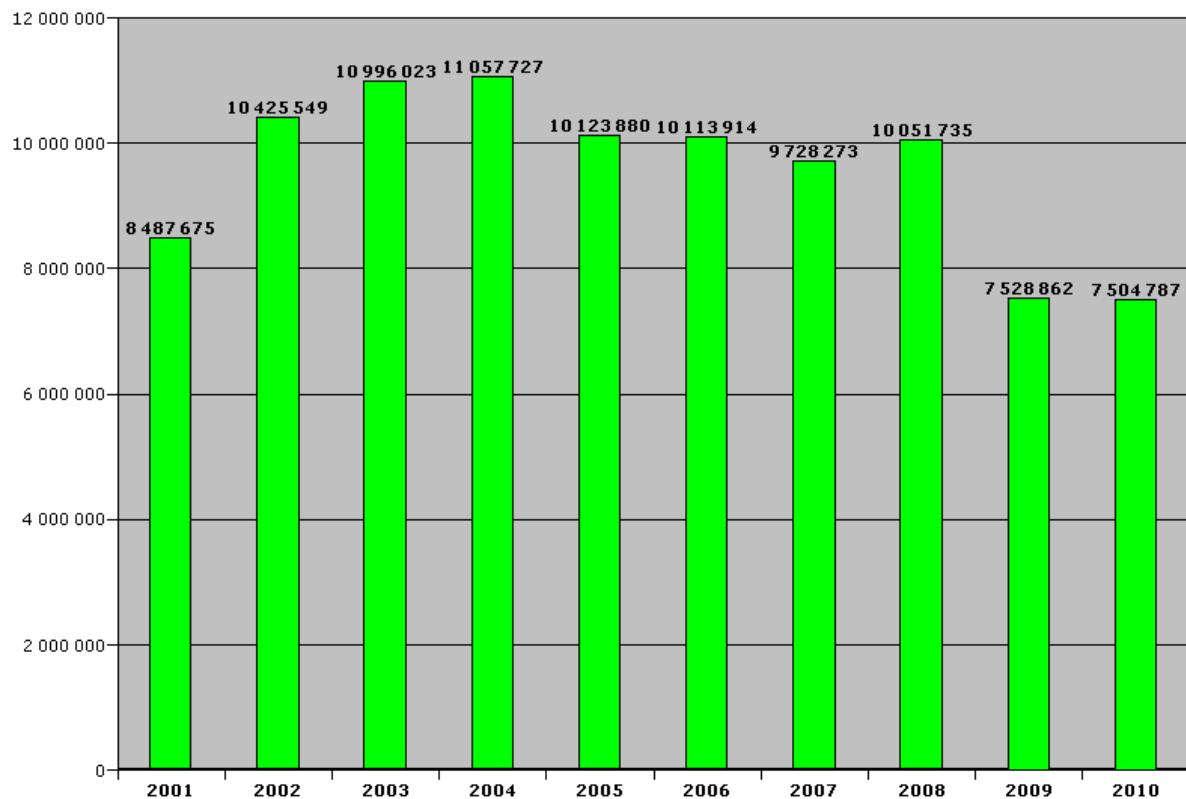

The information was extracted directly from the electronic submission of monthly and case reports by Member States. The monthly information is often updated and/or corrected by the Member States in following reports. The information shown in the following summaries is updated according to the information received electronically until 21 November 2011. Information on adult cattle population in 2010 was obtained from Eurostat.

### **4.1. Sampling**

#### **Comments on the sampling**

In the absence of any decision to raise the age limit for BSE testing, apart from Cyprus, the monitoring programme carried out in 2010 remained at a similar level as in 2009. Over 96 million cattle have been tested in the EU since 2001.

## **4.2. BSE positive cases**

### **Comments on BSE positive cases**

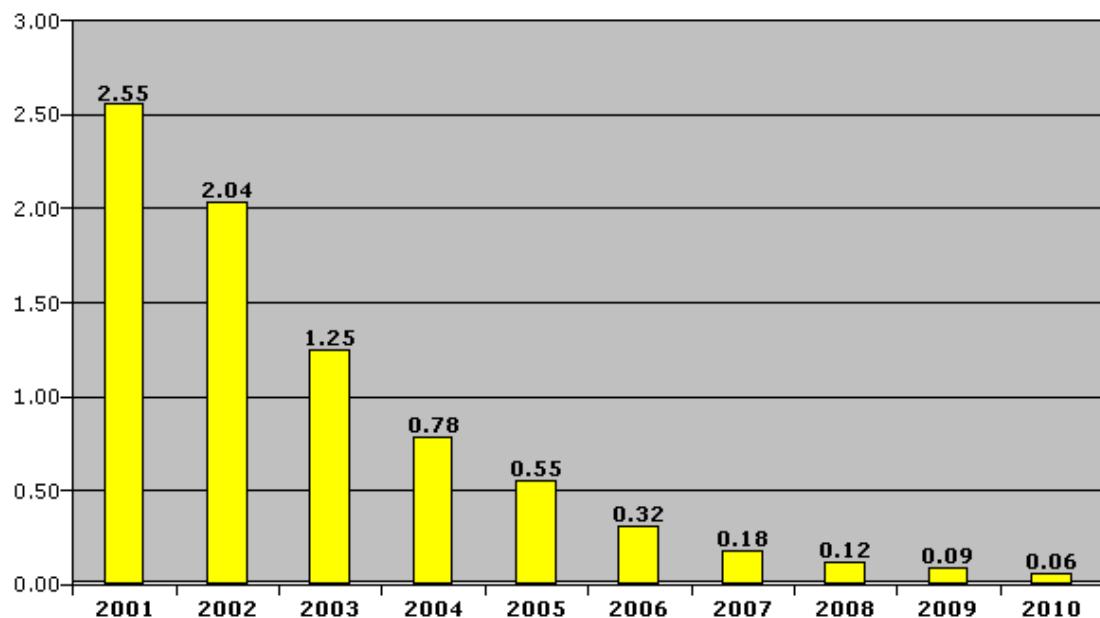

When analysing the evolution of BSE positive cases, it should be kept in mind that active monitoring was limited before 2001 and has decreased since 2009 for some Member States due to the modification of the age limit for testing. The expanded active monitoring became fully applicable in July 2001. The annual number of tests was about 25 % higher in the period 2002-2008 than in 2001 (see Chart B1). Despite the fact that the number of tests remained stable between 2002 and 2008, and decreased since 2009, the prevalence of BSE in tested animals (ratio of positives per 10 000 tests) has been steadily dropping since 2002, due to the decline in positive cases.

Overall the number of cases and the prevalence in tested animals of BSE both dropped by 33 % in the EU in 2010 compared to 2009.

**Chart B2: Evolution of the number of BSE positive cases in the EU since 2001**

**Chart B3: Evolution of the prevalence (ratio of BSE cases per 10 000 animals tested) of BSE positive cases in animals tested in the EU since 2001**

**Table B4: Evolution of positive cases world-wide since BSE was recognised**

\* positive cases per 10 000 bovine animals tested

**Chart B6: Evolution of the BSE cases prevalence rate\* in cattle tested by active monitoring\*\*, per target group, from 2006 to 2010**

\* positive cases per 10 000 bovine animals tested

\*\* fallen stock, emergency slaughter, animals with clinical signs at AM, healthy slaughtered animals, animals culled in connection to a BSE case

### Comments on testing by target group

Figures between different Member States should be compared with caution as:

- The results of different target groups are interdependent and should not be viewed in isolation. For example, an effective passive surveillance will increase the number of cases found in suspects and may at the same time decrease the ratio of positive cases in the other target groups, in particular in fallen stock and emergency slaughtered animals. In addition the policy on emergency slaughter may vary between Member States which will have an impact on the cases detected in this surveillance stream.
- Different monitoring programmes were run in 2010. Testing older cattle decreases the denominator and results in a higher calculated prevalence. In addition, in the case of UK, the testing focussed on animals born after the date of the effective feed ban (August 1996).

The figures illustrate that the likelihood of finding BSE cases is much higher in fallen stock, emergency slaughtered cattle and cattle with general clinical signs at ante-mortem ('risk animals') than in healthy slaughtered cattle.

#### 4.4. Age distribution of BSE positive cases

**Chart B7: Average age (in months) of BSE positive cases detected in the EU from 2001 to 2010**

### **Comments on the age distribution of BSE positive animals**

The previous tables and charts illustrate that there are differences between Member States in the age profile of positive cases in 2010 as was already observed in the previous years.

While the average age of BSE cases detected in healthy slaughtered animals has sharply risen in 2010, it can be noted that it has dropped for the first time in 2010 in risk animals. The evolution of this indicator will have to be closely monitored in 2011.

However, the overall evolution of the average age of positive cases still appears favourable since 2001. Taking into consideration an average incubation period of 5-6 years, these figures are an indication that measures taken (mainly feed ban) have been effective.

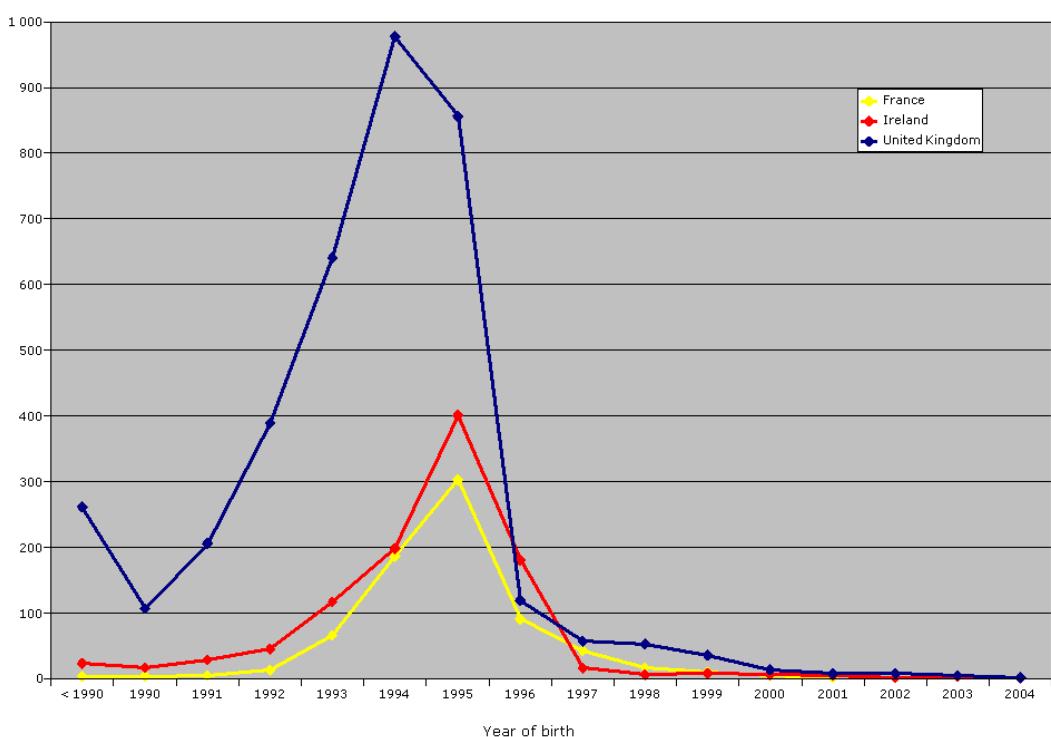

#### 4.5. Year of birth distribution of BSE positive cases detected since 2001

**Charts B8 and B9: Distribution of number of BSE cases per year of birth detected from 2001 to 2010**

**Chart B8**

**Chart B9**

**Comments on the year of birth distribution of positive animals**

The previous tables and charts only take account of cases detected since 2001 and does not include cases detected before 2001. However, differences between Member States with regard to the year of birth with the highest percentage of positive cases may be an indication of differences in the period of exposure to the agent and of the effectiveness of measures to prevent transmission of the agent, in particular the feed ban.

#### 4.6. Prevalence of BSE in different age categories in 2010

## 5. SUMMARY OF TSE TESTING IN OVINE AND CAPRINE ANIMALS DURING 2010

The information is extracted directly from the monthly and case reports electronically submitted by the Member States in 2010 and the information available since 2002. The monthly information is often updated and/or corrected by the Member States in subsequent reports. The information shown in the following summaries is updated according to the information received up to 21 November 2011. Due to technical submission issues, the TSE case reports of Greece and Cyprus remained unavailable at this date.

### 5.1. Sampling

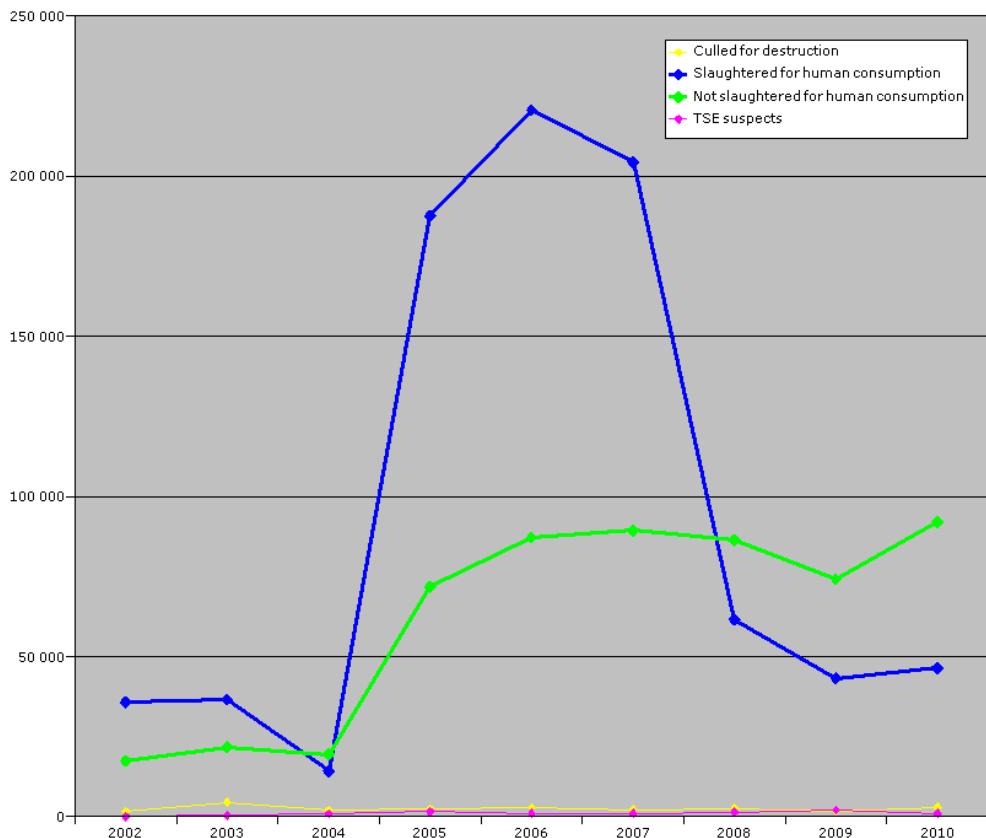

The total number of samples and the number of samples per target group and per Member State can be found in the following tables and charts

**Chart SR1: Evolution of TSE testing in sheep in the EU 27 from 2002 to 2010**

	2002	2003	2004	2005	2006	2007	2008	2009	2010
<b>Culled for destruction</b>	39 755	31 130	22 197	26 606	46 704	33 340	24 499	14 232	12 260
<b>Slaughtered for human consumption</b>	240 785	349 071	146 163	155 104	602 656	409 278	219 240	151 159	150 436
<b>Not slaughtered for human consumption</b>	70 823	110 810	142 746	171 878	408 504	420 809	219 656	179 114	180 756
<b>TSE suspects</b>	2 753	1 294	2 667	2 424	2 657	1 915	2 075	1 104	759

**Chart SR2: Evolution of TSE testing in goats in the EU 27 from 2002 to 2010**

	2002	2003	2004	2005	2006	2007	2008	2009	2010
<b>Culled for destruction</b>	1 580	4 571	2 007	2 377	2 846	2 209	2 635	1 886	3 038
<b>Slaughtered for human consumption</b>	35 732	36 598	14 301	187 541	220 640	204 382	61 589	43 270	46 414
<b>Not slaughtered for human consumption</b>	17 450	21 803	19 463	71 691	87 271	89 372	86 343	74 162	92 106
<b>TSE suspects</b>	65	429	1 033	1 560	1 129	1 156	1 471	2 149	1 110

### Comments on sampling

After declining from 2007 to 2009, the overall number of small ruminants tested for TSE in 2010 remained stable in sheep and slightly increased in goats, France alone contributing for half the tests in goats.

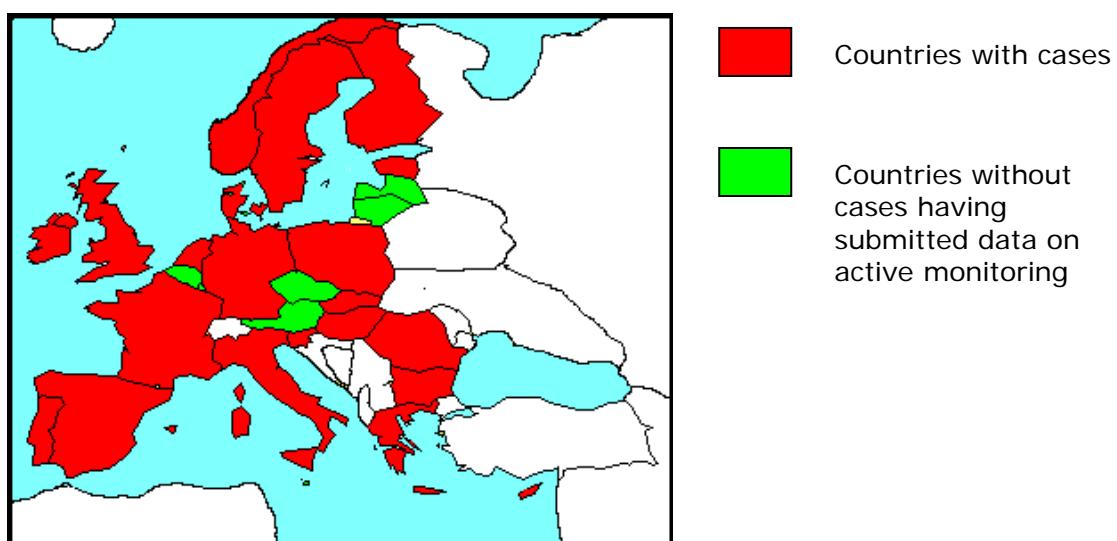

## 5.2. Positive cases

**Table SR1: Total TSE positive cases detected in ovine and caprine animals detected and prevalence rate in animals tested in 2010**

**Chart SR7: Prevalence rate (cases per 10 000 tested) of TSE in healthy slaughtered and risk ovine animals in the EU 27 (except Cyprus) and Norway tested from 2002 to 2010**

**Chart SR8: Prevalence rate (cases per 10 000 tests) of TSE in healthy slaughtered and risk caprine animals in the EU 27 (except Cyprus) and Norway tested from 2002 to 2010**

**Chart SR9: Evolution of the overall prevalence rate (cases per 10 000 tested) of TSE in small ruminants in the EU (except Cyprus and Ellas) from 2002 to 2010**

There is still no clear trend with regard to the evolution of the prevalence of TSE in tested animals of both species as well as in the different target groups.

The prevalence of TSE in sheep is higher than in goats in the EU (Cyprus and Greece excluded).

Prevalence in tested animals not slaughtered for human consumption (risk animals, mainly fallen stock) is higher than in healthy slaughtered sheep or goats.

Cyprus seems to have a very significantly higher prevalence of TSE in goats than any other Member States.

In the sheep sector, Cyprus and to a lower extent Greece show a higher prevalence of TSE than the other Member States.

### 5.3. Atypical cases

**Table SR8: TSE cases in small ruminants reported as atypical from 2004 to 2010 (animals culled in the frame of TSE eradication are excluded)**

### Comments on atypical cases

Atypical TSE cases were demonstrated in several Member States. Atypical TSE even accounts quite consistently, year after year, for a large majority if not 100% of TSE cases in some Member States, e.g. in Denmark, Portugal, Hungary or Sweden. In some other Member States, e.g. France and the UK, the proportion of atypical TSE cases has been steadily growing since 2004, passing from a small share to a large majority of the TSE cases. These results should however be interpreted with caution as the monitoring requirements have changed during this period and the testing and sampling methods have an influence on the detection of atypical cases.

The definition of atypical cases detected from 2004 to 2010 is in line with the Opinion of the Scientific Panel on Biological Hazards of the European Food Safety Authority on classification of atypical TSE cases in small ruminant adopted on 26 October 2005.

## 5.4. TSE discriminatory tests

**Table SR11: Discriminatory testing on TSE cases confirmed in sheep and goats in 2010**

**Results of primary molecular testing with a discriminatory immunoblotting (Point 3.2 c(i), Chapter C , Annex X to Regulation (EC) 999/2001).**

**Chart SR10: Evolution of the age distribution of positive cases in sheep in the EU 27 and Norway since 2002**

**Chart SR11: Age distribution of positive cases in sheep detected since 2002 in the EU 25 and Norway: comparison of cases reported as atypical with other cases**

## 5.6. Genotyping

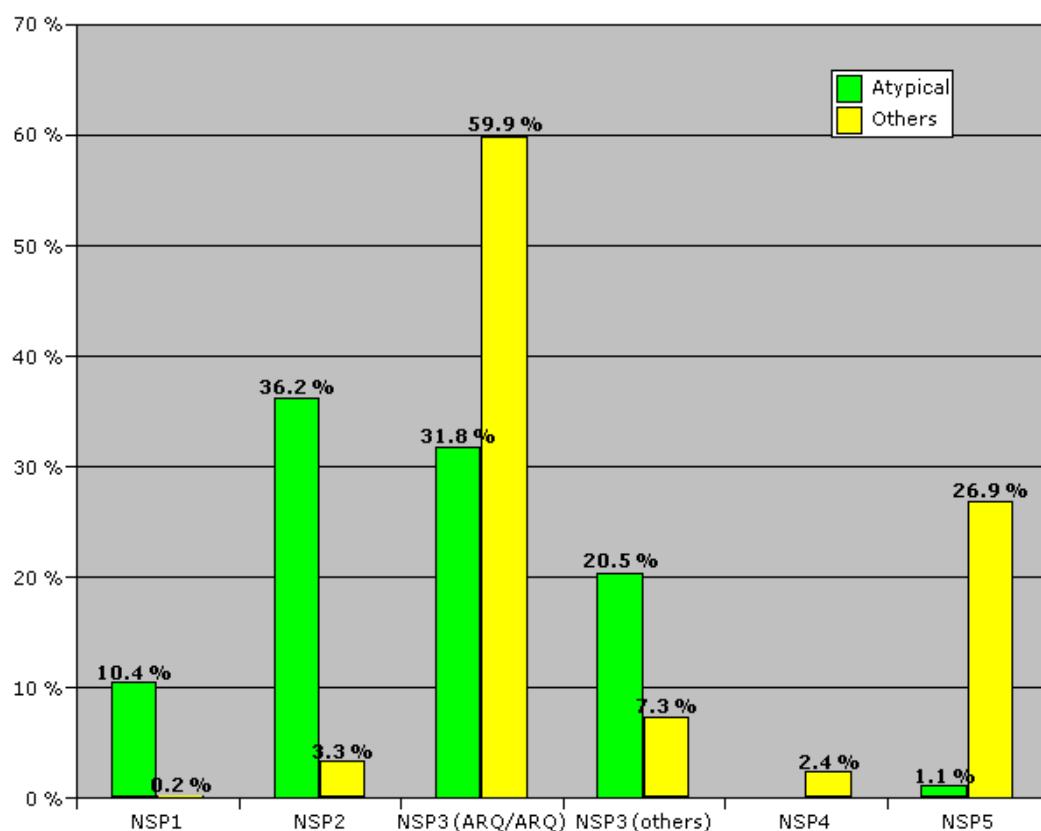

The genotypes found in positive cases and by random sampling were grouped in accordance with the NSP classification system used in the United Kingdom for genetic resistance to classical scrapie and BSE:

<b>NSP1</b>	<b>ARR/ARR</b>	<b>Genetically most resistant</b>
<b>NSP2</b>	<b>ARR/ARQ, ARR/ARH, ARR/ AHQ</b>	<b>Genetically resistant</b>
<b>NSP3 (ARQ/ARQ)</b>	<b>ARQ/ARQ</b>	<b>Genetically little resistance (ARQ/ARQ may be scientifically reviewed)</b>
<b>NSP3 (others)</b>	<b>AHQ/AHQ, ARH/ARH, ARH/ ARQ, AHQ/ARH, AHQ/ARQ</b>	
<b>NSP4</b>	<b>ARR/VRQ</b>	<b>Genetically susceptible</b>
<b>NSP5</b>	<b>ARQ/VRQ, ARH/VRQ, AHQ/VRQ, VRQ/VRQ</b>	<b>Genetically highly susceptible</b>

**Table SR14: Distribution of known genotypes in confirmed TSE cases in 2010**

	Known no of TSE cases genotyped	% of TSE cases genotyped	Distribution of known genotypes					
			NSP1	NSP2	NSP3		NSP4	NSP5
					ARQ/ARQ	Others		
Polska	2	100 %	0%	0%	50 %	50 %	0%	0%
Danmark	1	50 %	0%	0%	0%	100 %	0%	0%
