

Building a dynamic and integrated compendium (multi-dimensional aspects)

What dimensions are we “integrating”?

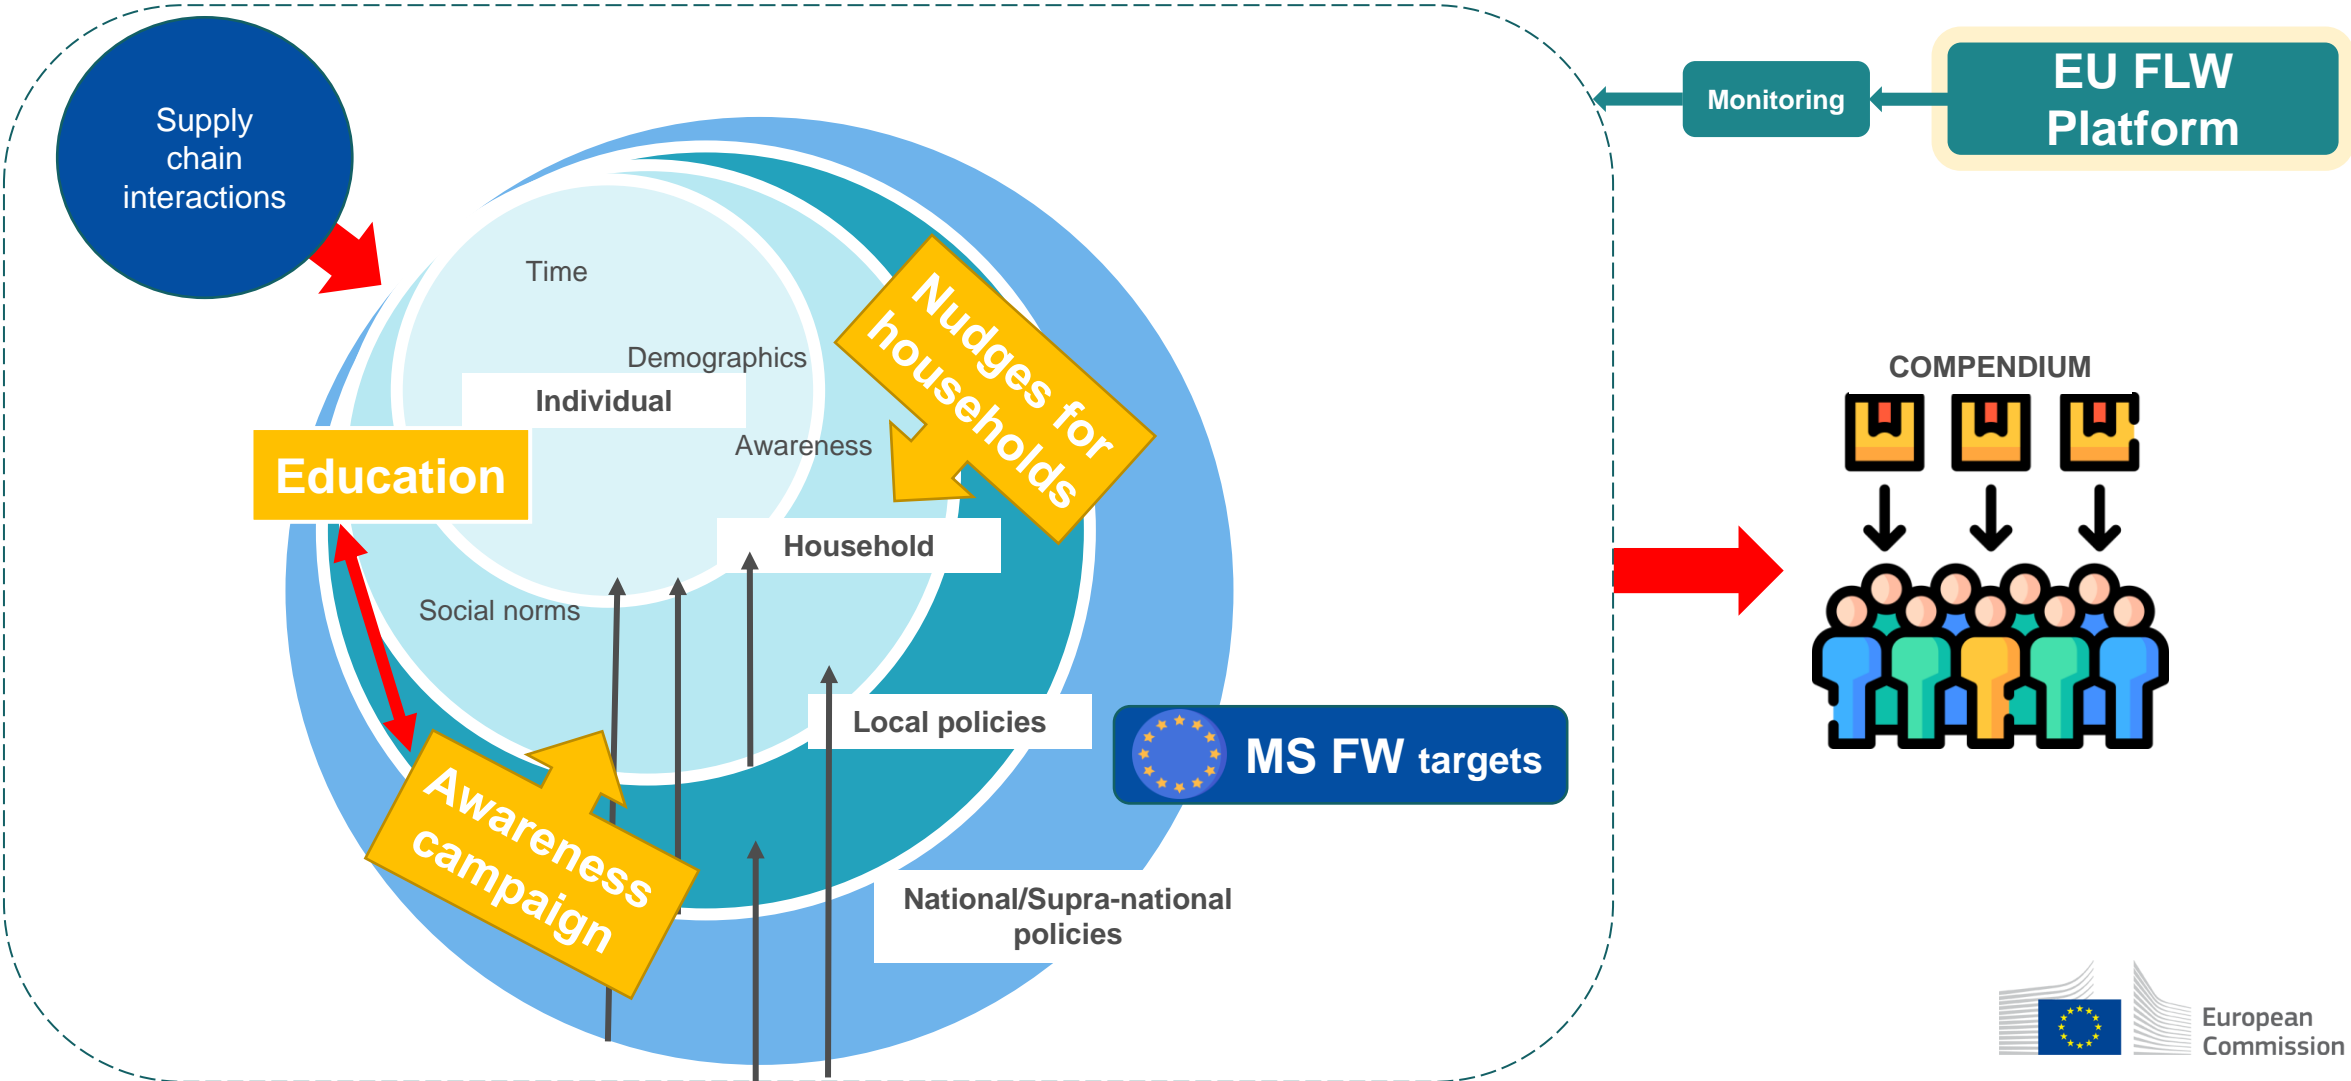

- Aspects characterizing the interventions/tools: action design, monitoring, evaluation and knowledge-sharing.

- Behavioural aspects: motivation, opportunity and capability to reduce food waste.
- Related issues/policies, e.g. related to health policies, the economic framework, resource efficiency and waste policies

**Organize synergies between interventions
and with other issues/policies**

Dynamic compendium

Our objective in a nutshell

- Consider consumer food waste in the broader context of the food system
- Organize interventions across a timeline to maximise effectiveness
 - *For example: a national awareness campaign followed up by smaller/localized interventions for households and education in schools*
- Coordinate interventions at global and local scales and between actors of the value chain
- Disseminate interventions/tools into schemes where they are beneficial
- Consider actions by the public sector specifically

Plenary discussion – inputs from the Platform

- Do you have examples/ideas of interventions that should be coordinated?
- How can we connect resources developed by the Forum to other priorities (e.g. climate change, biodiversity, purchasing power etc.)?
- How can Platform members help further disseminate ECFWF resources?
