

EUROPEAN COMMISSION
HEALTH & CONSUMERS DIRECTORATE-GENERAL
Unit 04 - Veterinary Control Programmes

SANCO/3931/2008

Programmes for the eradication, control and monitoring of certain animal diseases and zoonoses

Multi-annual programme for the eradication of Rabies

Approved* for 2009 by Commission Decision 2008/897/EC

Czech Republic

* in accordance with Commission Decision 90/424/EEC

Multi-annual programme for the control of Rabies in the Czech Republic - 2009

Multi-annual programme for the control of Rabies 2008 - 2009

Member State: **Czech Republic**

Disease: **Rabies**

Year of implementation: **2009**

The programme has been approved by Commision Decission 2007/782/EC

Organisation responsible for the programme:

State Veterinary Administration of the Czech Republic

Department of Animal Health and Welfare

Slezská 7

120 56 Prague 2

Contact Name: MVDr. Petr Šatrán, Ph.D.
 Phone: +420227010150
 Fax: +420227010195
 E-mail: epiz@svscr.cz

Date sent to the Commission: 29. 4. 2008

1. Historical data on the epidemiological evolution of the disease:

Rabies history

The Czech Republic belongs to those countries in which the incidence of rabies in wildlife was steadily increasing since the 1950s until 1980s.

Continual research carried out during 1960 – 1980 proved that rabies had become endemic in the border areas of West and North Bohemia and North Moravia. The importance of foxes in rabies epidemiology increased and red fox became the principal vector of rabies in the Czech Republic. Neither subsidies payment for hunted foxes, which was introduced in 1969, nor gassing of fox dens, carried out during 1979-1984, did not improved the situation.

In the 1980s rabies reached its greatest geographical range. With the exception of several districts, the whole territory of the Czech Republic was affected. The oral vaccination of foxes was launched in a few districts adjacent to German borders in 1989 and implemented further thereafter. Since that time continual decline has been visible especially since 1992 when positive effect of oral vaccination has become evident

Status of Rabies

The rabies data reported during the last thirteen years indicate the development of the rabies situation in our country since the beginning of oral vaccination. In the period 1989 to 2005, 154 661 animals were examined for rabies. The major part of them were foxes (more than 50%) followed by cats and dogs participating by 30 % together.

Rabies was diagnosed in 6 180 cases during this thirteen year period. The highest number of rabies cases was recorded in 1989 reaching 1 501 cases. The lowest occurrence was recorded in April 2002(the last 3 cases in red foxes). In 2004 the Czech Republic obtained a status of a country officially free of rabies. In 2005 one positive bat for rabies was recorded. In 2006 and 2007 there was no positive finding of Rabies in the Czech Republic.

2. Description of the programme for Rabies control:

Domestic animals

Preventive vaccination of domestic carnivores and if necessary, domestic herbivores is the principal method of domestic animals protection. The inactivated tissue-culture vaccines are used exclusively for this purpose.

Wildlife animals

The strategy of rabies control is based on reduction of wildlife reservoir of the virus by oral vaccination of foxes.

Oral vaccination of foxes

The field trial of oral immunization of foxes was started in the Czech Republic in spring 1989. The project planning and organization was prepared according to the rules of the WHO, in close co-operation with the Rabies Centre in Tübingen.

The first application of the oral rabies vaccine was carried out in the districts Klatovy, Domažlice, Tachov adjacent to German border in the spring 1989. In the course of next campaigns the treated area was extended covering 44 districts in autumn 1992. In the autumn 1993 the whole territory of the Czech Republic, with exception of rabies free districts bordering Germany, was included.

The "Bavarian model" was applied during all vaccination campaigns. The hunters placed the vaccine baits manually in their hunting preserves. The strategy of vaccine baits distribution twice a year in spring and autumn was applied. Veterinary authorities were responsible for coordination and supervision of the campaigns at the district level. The original baits density 16 doses per 1 km² were gradually increased, mainly in the areas with non-favourable epidemiological situation. Since 1996, the aerial distribution of the vaccine baits was used on restricted territory (4 - 6 districts). In 2002 the aerial vaccination was extended reaching 50% of treated territory (29 districts). The aerial vaccination was extended reaching 99% of treated territory in 2004.

Results of oral vaccination 1996 – 2007

Control examinations following baits distribution were oriented to baits uptake, rabies diagnosis, tetracycline marking, characterization of virus strains and antibody formation. The indirect measuring of baits uptake was obtained by the examination of fox bones for tetracycline incorporation.

Oral vaccination had undisputable positive influence on rabies incidence. A considerable reduction of positive findings was noticed, - from 1501 cases started in 1989 to 3 cases in 2002. An increase was registered in the year 1999 (214 cases). Since 2003 to 2005 only one positive bat for rabies was recorded. In the year 2006 and 2007 there was no occurrence of Rabies on the whole territory of the Czech Republic.

3. Measures of the submitted programme for oral vaccination of foxes

Summary of measures under the programme

Duration of the programme

The oral vaccination has been carried out since 1989 and it is foreseen to continue with oral vaccination of foxes to the end of the year 2009. Regarding recent occurrence of Rabies and epidemiological situation abroad it is foreseen to create and keep the buffer zone around the borders to Poland and Slovakia. The final decision about termination of the oral vaccination will be taken according to the epidemiological assessment in the year 2009. In respect to present epidemiological situation we assume that year 2009 will final year of oral vaccination in the Czech Republic.

Designation of the central authority charged with supervising and coordinating the departments responsible for implementing the programme:

The central authority competent for supervising and coordinating all activities in veterinary care is the State Veterinary Administration, which performs its powers at the whole territory of the Czech Republic (§ 47, Veterinary Act No 166/1999 Coll. of Acts). SVA of the CR coordinates the activities of Regional Veterinary Administrations.

The Department of Animal Health and Welfare in co-operation with the National reference Laboratory for Rabies will prepare a concrete plan of the oral vaccination according the present rabies situation. This plan is approved by the State Veterinary Administration afterwards. Regular meetings are organised with the participation of the representatives of the air-company, the vaccine manufacturer and the representatives of the Regional Veterinary Administrations from districts which are involved in the vaccinated area. The exact timetable and further details are discussed at these meetings, such as:

- Distribution of the vaccine and its storage before vaccination and the delivery conditions to the airport (storage at -20° C).
- In the districts, where the vaccine is distributed manually the exact date and time of the vaccine bait distribution is fixed. The distribution to hunters and control of the vaccination is organised at the district level by Veterinary bodies.

A vaccine producer is selected in the tendering procedure. This company also ensured the aerial distribution of vaccine baits in current year. Manual distribution is carried out by hunting organisations in compliance with the instructions of the Regional Veterinary Administration.

Description and delimitation of the geographical and administrative areas in which the programme is to be applied:

The planned extent of buffer zone in 2009 (spring and autumn):

Area to be covered* **30 021 km²**

Number of doses' **753 200 baits**

* One vaccination campaign only

For information about regional distribution see annex 1.

System in place for the registration of holdings:

The program will be performing in wild life population of foxes.

System in place for identification of animals:

The program will perform in wild life population of foxes without any identification of target animals.

Measures in place as regards the notification of the disease:

In the case of Rabies positive results the protective and control measures will be imposed according to the provisions of the Veterinary Act No. 166/1999 as amended.

Measures and terms of legislation as regards the control vaccination of the disease:

Control of baits acceptance after manual placement:

In the vaccinating areas, a distribution team checks the baiting sites on days 4, 8 and 14 following the placement. The number of baits taken is recorded into a protocol. The hunters also look out for animal signs and tracks, teeth marks in vaccine capsules in order to identify the animal species, which took the bait. The results are collected by veterinary inspectors and then are submitted to the National Reference Laboratory for rabies.

Follow up examinations:

At least 8 –10 foxes per 100 km² per year must be presented for rabies examination and further control investigation. That means about 50 foxes per district after each campaign. Not vaccinated districts have to be also included into the surveillance area. Beside of these, clinically suspect and found dead animals from all over the country should be analysed for rabies.

The evaluation of the efficacy includes:

- % of the bait uptake
- % of the TTC marker positivity
- Asses of the Rabies epidemiological situation

Measures and terms of legislation as regards the measures in the case of positive results:

In the case of Rabies positive results the protective and control measures will be imposed according to the provisions of the Veterinary Act No. 166/1999 coll., as amended.

3. 10. Measures and terms of legislation as regards the compensation for owners of slaughtered and killed animals:

In the case of Rabies positive results the protective and control measures will be imposed according to the provisions of the Veterinary Act No. 166/1999 coll., §67, as amended and 100% compensation for owners is established.

4. General description of the costs and benefits

4. 1. 1. Temporal pattern

The spring and autumn campaigns are organized annually.

Timing for aerial and manual vaccination:

Spring – April

Autumn - October.

4. 1. 2. Vaccines

Since 1992, only Czech made live attenuated vaccine SAD - Bern has been used for vaccination campaigns. Producer is Bioveta a.s., Ivanovice na Hané. More information about the vaccine you can see in the package insert attached in ANNEX.

4. 1. 3. Distribution

Aerial distribution – by a fixed-wing plane. Density = 25 - 30 baits/km².

Aerial distribution is the main method for distribution. Each campaign of aerial vaccination is coordinated and supervised by state veterinary inspectors. Each inspector is responsible for

area about 9 000 km² closed to one airport. The GPS system is used for navigation and flying lines are recorded by computer and printed out on a map. The distance of flight lines is 500 m; the speed is 150 –160 km per hour. The distribution by plane is more efficient than by hand with respect to a long – term vaccination. Better treatment is reached especially in the hilly areas.

Financial expenses in CzK

<i>Year</i>	<i>Price of baits*</i>	<i>Price for transport and storage</i>	<i>Price for laying by airplane*</i>	<i>Price for laying by hand</i>
<i>Spring 2009*</i>	8 847 500	0	4 389 070,20	0
<i>Autumn 2009*</i>	8 847 500	0	4 389 070,20	0
<i>Total 2009*</i>	17 695 000	0	8 778 140,40	0

* Prices are without tax (VAT)

For more details, see ANNEX

5. Data on the epidemiological evolution during the last five years

The Czech Republic remained rabies-free. The last rabies case was found in April of 2002 in a red fox in the district of Trutnov close to the border with Poland. Since that time there has not been a single case of rabies diagnosed. The Czech Republic thereby fulfilled the criteria for recognition as a rabies-free state. This event was documented in the OIE journal Disease Information No. 30, 23 June 2004. Also, the Czech Republic has remained rabies-free for 2004, 2005, 2006 and 2007.

6. 1. Number of foxes examined per 100 km²

Year	Number of examined	Number/100 km ²
2000	6 411	10,6
2001	5 281	8,8
2002	6 607	11,0
2003	6 248	10,4
2004	7 164	11,9
2005	8 242	12,9
2006	7 066	11,7
2007	8 401	14

6. 2. Monitoring of wildlife

Animal species: Fox

Virological tests, which are used: Direct Immunofluorescent Test and Mouse isolation test.

Control of vaccination efficacy is performing by biomarker detection test and Serum neutralization test on cell culture.

Surveillance of Vaccination efficiency in red foxes in 2007 the evaluation of the efficacy

Laboratory examination for rabies in the CR – 2007

6. Targets on vaccination of wildlife

Disease: Rabies

Animal species: Fox

Number of baits to be laid down in the frame of the programme

Campaign	Number of baits	Area in km ²	Area in km ² by hand	Area in km ² by airplane
<i>Spring 2009</i>	753 200	30 021	0	30 021
<i>Autumn 2009</i>	753 200	30 021	0	30 021
<i>Total 2009</i>	1 506 400	60 042	0	60 042

For more details and regional distribution, see tables and maps in annexes.

Testing scheme

After each campaign, specimens of wildlife animals are collected within vaccination area for examination, as recommended by WHO. At least 8 – 10 foxes per 100 km² per annum must be presented for rabies examination and further control investigation. That means about 50 foxes per district after each campaign. No vaccinated districts have to be also included into surveillance area. Beside of these clinically suspect and found dead animals from all over country should be analysed for rabies.

Control examination following bait distribution should be directed at bait uptake, rabies diagnosis, tetracycline marking, characterization of virus strains and antibody formation. The indirect measuring of bait uptake is obtained by the examination of fox bones for tetracycline incorporation. Antibody formation is tested in the body fluids. Specific virus neutralizing antibodies are detected.

7.1.1.1. Number and specification of tests to be carried out in the year 2009

Region	Type of tests	Target population	Type of sample	Objective	Number of planned tests
Central Bohemia	FAT,SNT,TTC	Fox	Brain,Blood,Bone	monitoring of campaigns	950
Hradec Králové	FAT,SNT,TTC	Fox	Brain,Blood,Bone	monitoring of campaigns	750
Karlovy Vary	FAT,SNT,TTC	Fox	Brain,Blood,Bone	monitoring of campaigns	300
Liberec	FAT,SNT,TTC	Fox	Brain,Blood,Bone	monitoring of campaigns	550

PACKAGE INSERT

LYSVULPEN por. ad us. vet.

Vaccine against rabies. Intended for oral immunization.

Qualitative and quantitative composition

Composition - 1 dose = 1.8 ml:

-Virus rabici attenuatum SAD Berne min. 1.8×10^7 TCID₅₀ max. 1.8×10^8 TCID₅₀

- MEM culture medium, stabilizing medium, bait material with tetracycline

Pharmaceutical form

The vaccine is intended for oral application and is contained in an aluminium-plastic blister, placed in the bait consisting of a special feeding mixture.

Immunobiological characteristics

Pharmacotherapeutical group: 97 Veterinaria immunopreparata

ATC classification: Q1SAA Veterinary vaccines

The principle of the immunization effect of the vaccine is that, upon chewing the capsule containing the vaccination virus inside the bait, the vaccination virus escapes from the perforated capsule to the surface of the mucosae and tonsils in the oral cavity. In a vaccinated individual, the virus is recognized to be extraneous and activation of the immunity system starts and protective virus-neutralizing antibodies start creating. In this way, the immunized foxes and other species of target animals are protected against infection with the virulent field rabies virus and are unable to transmit rabies further. Immunity in the vaccinated animals lasts for at least one year.

Protective effect against rabies may be accomplished only in uninfected foxes and raccoon dogs. The presence of colostral antibodies against rabies has a negative impact on the creation and protective immunity in fox cubs and raccoon dogs as well. The ingurgitation of more bait is harmless to the target species. The harmlessness of the vaccine has also been demonstrated in domestic animals (dogs, cats).

The vaccination rabies virus may be distinguished from the field rabies virus by means of monoclonal antibodies.

Immunization in foxes and other species of target animals occurs after the ingurgitation of laid-out immunization baits containing the vaccination virus. Immunity in the immunized foxes and other target species forms after 21 days following ingurgitation of the bait containing the vaccination virus.

Business denomination and registered office of the holder of the resolution on registration

Bioveta, a. s., Komenského 212

683 23 Ivanovice na Hané

Česká republika

Target species: Red fox (*Vulpes vulpes*), raccoon dogs (*Nyctereutes procyonoides*).

Withdrawal periods: Not intended for food-producing animals.

Indication: To be used for the prophylactic vaccination of feral foxes and raccoon dogs against rabies.

Contraindication: The vaccine is not to be used for the immunization of domestic animals.

Special advice concerning safe use of the preparation

Until laid out, either manually or by aircraft, the vaccine must not be exposed to temperatures exceeding 15 °C (it is to be distributed in thermo-eases or packed in heat-insulating material so that the vaccine is sufficiently protected against the effect of excessive external temperatures). If laid out manually in a field, the bait is to be tipped out of the cardboard box carefully. The bait is to be laid in spots that are protected from direct sunlight. After being laid out, the bait shall be covered with natural material (leaves, grass, soil etc.) to be protected from the sun.

To prevent the hands from coming into direct contact with the bait, it is necessary to use protective gloves when laying out the bait in order to avoid the effects of human scent on the bait. The gloves are disposable (intended for the unloading of 1 carton - 20 bait items).

During the winter, at temperatures below 0 °C, the bait is not to be laid open in a field. After perforating the blister, the deep-frozen vaccine contained inside the bait may not come out, reach the mucosae of the oral cavity and thus immunize the animal. Two weeks after laying the bait, the free movement of dogs and cats should be avoided within the vaccination zone as these animals represent competitors for the bait. The areas in which vaccination is performed are to be duly marked and the respective inhabitants must be informed in an adequate manner.

The vaccine contains attenuated vaccination rabies virus. If the vaccine (the content of the aluminium-plastic blister deposited in the bait) comes into contact with human eyes, mouth, nose or broken skin, contact a physician immediately. In this case, medical procedures are conducted pursuant to the guidelines in force, dealing with exposure to the rabies virus. If the hands or other uncovered body parts become stained with the vaccine, the affected spot is to be duly washed with soap and water. The bait containing the vaccine must be stored out of the reach of unauthorized persons, especially children!

Interaction with other veterinary preparations and other forms of interaction

Unknown so far.

Dosage and method of administration

The immunization of the target species forms after the ingurgitation of the laid-out bait containing the vaccination virus. The vaccine is laid twice a year, namely in April or May and September or October. Usually, 15 to 20 baits or more are laid out for each square meter, depending on the epizootologic situation and population density, especially the fox population density.

The baits with the vaccine have to be laid out throughout the entire area of the given territory. If an airplane or a helicopter is used, the flight lines must be adjusted to reach equal dispersion. For example, the baits are dropped every 250 meters, so the individual lines must also be at a distance of 250 meters from each other.

In the event of necessity provoked by a contagious situation in the given area, spring or autumn revaccination is recommended. It is also recommended to lay bait in a limited area in the summer or to lay the bait close to occupied fox dens in an amount of 10 baits per den.

An aerial form of bait distribution is recommended in free areas with a low population density. In areas which are densely populated, it is preferable to distribute the bait manually. Vaccination of the respective territory is to be performed for two consecutive years, but at least for three years after the last occurrence of rabies in the respective territory. The vaccine may also be used for a rabies-free territory in order to form a protective zone. The width of such a zone entrenching on territory with rabies occurrence should not be smaller than 50 kilometers.

Airplane distribution of bait

The bait is laid out in conformity with the previously prepared flight maps along the previously determined flight lines. The Satellite Navigation System (GPS) may be applied for orientation and correct distribution.

Undesirable effects: Unknown

Type of wrapping and size of package

a) Manual distribution

The vaccine (aluminium-plastic blister containing the vaccination virus inside a feeding mixture bait) is packaged in a cardboard box with a fixative grid per 20 baits.

The collated package in a carton contains 30 x 20 doses (i.e. 600 doses).

b) Airplane distribution

The vaccine (aluminium-plastic blister containing the vaccination virus inside a feeding mixture bait) is packaged:

- per 40 doses that are freely deposited in layers spaced with tapeten in a heat-insulated carton.

The collated package in a carton contains 10 x 40 doses.

- freely in polyethylene bags per 350 doses in a heat-insulated carton. The collated package in a carton contains 2 x 350 doses.

A package insert is attached with each package.

Method of storage and reference to the indication on termination of applicability, stated on the package, advise of the prohibition to use the preparation after the lapse of the applicability period

Store at a temperature of -20 and bellow.

The preparation must not be used after the lapse of the applicability period, indicated on the package.

Special measures concerning disposal of the unused veterinary preparation or of the waste originating from this preparation

The packages and any remainders of the preparation are to be disposed of pursuant to the regulations in force.
