

Food Services: One Solution Lukeloki and Results from Finland

11.5.2023

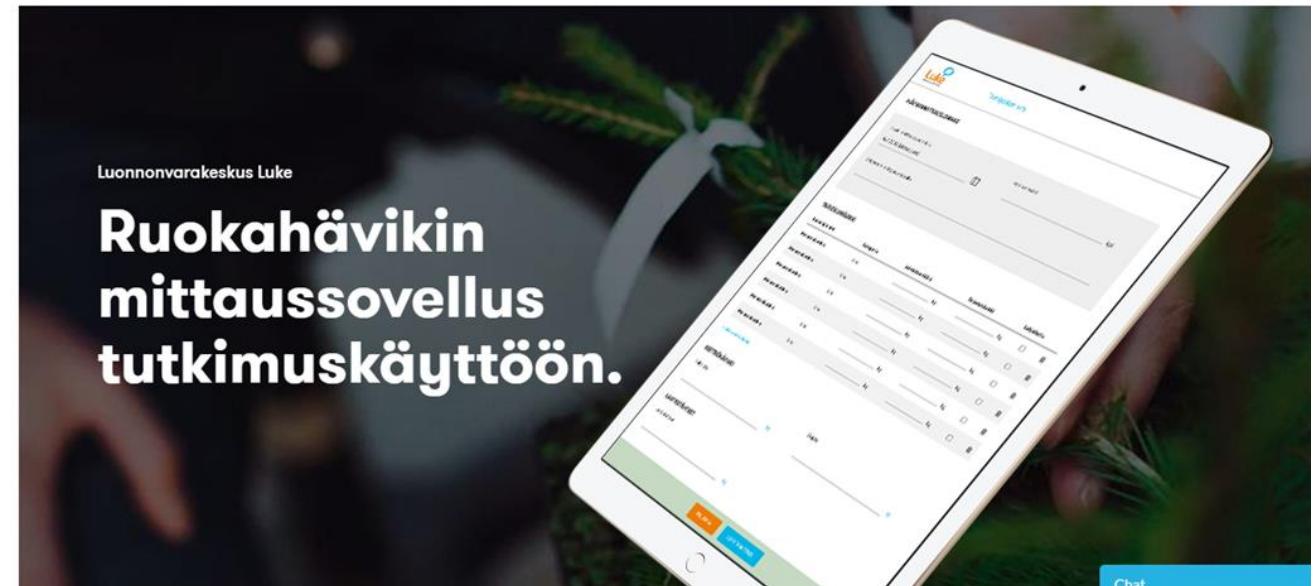

Kirsi Silvennoinen, Sampsa Nisonen

Luke has developed an online application *Lukeloki* for measuring food waste (FW) in food service companies

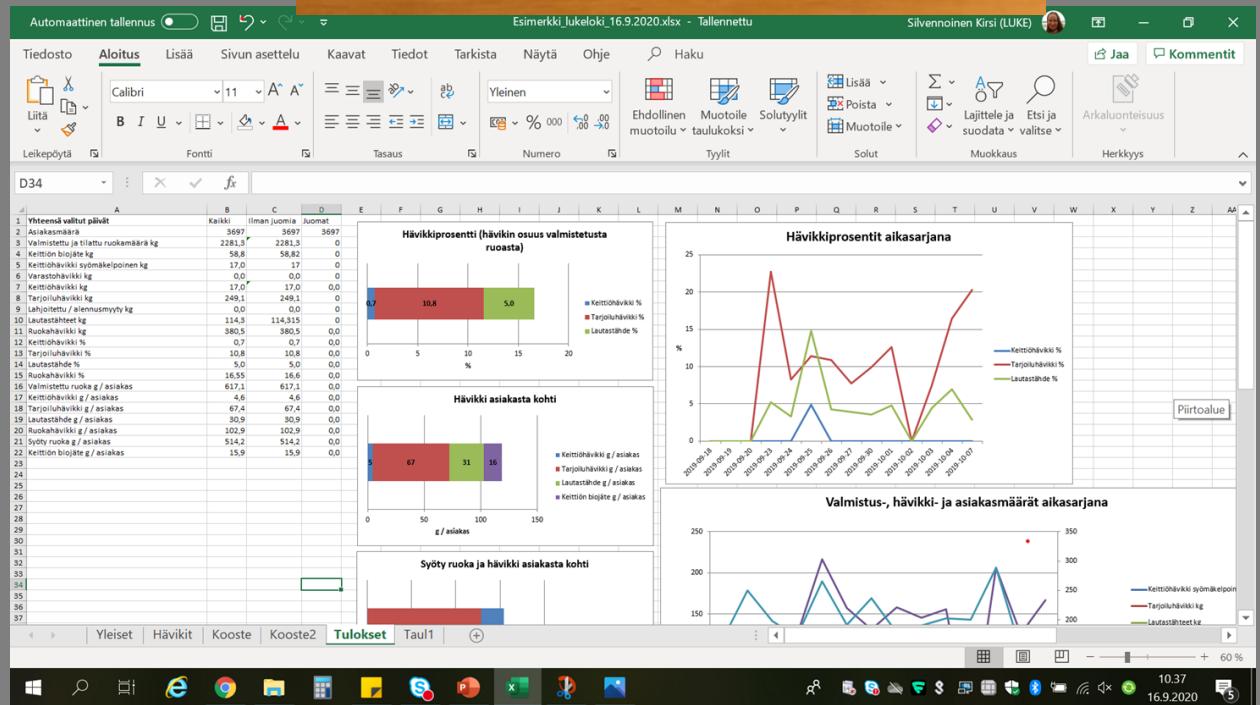

- When monitoring FW companies get up to date information on reaching their goals and can make decisions on how to reduce FW. Same time Luke will get data for research purposes.
- The application can be used with phone, tablet or computer by kitchen personnel. Food waste is logged in daily to the application by origin, and it is separated to kitchen waste, serving waste and customer plate leftovers.

Simple and easy

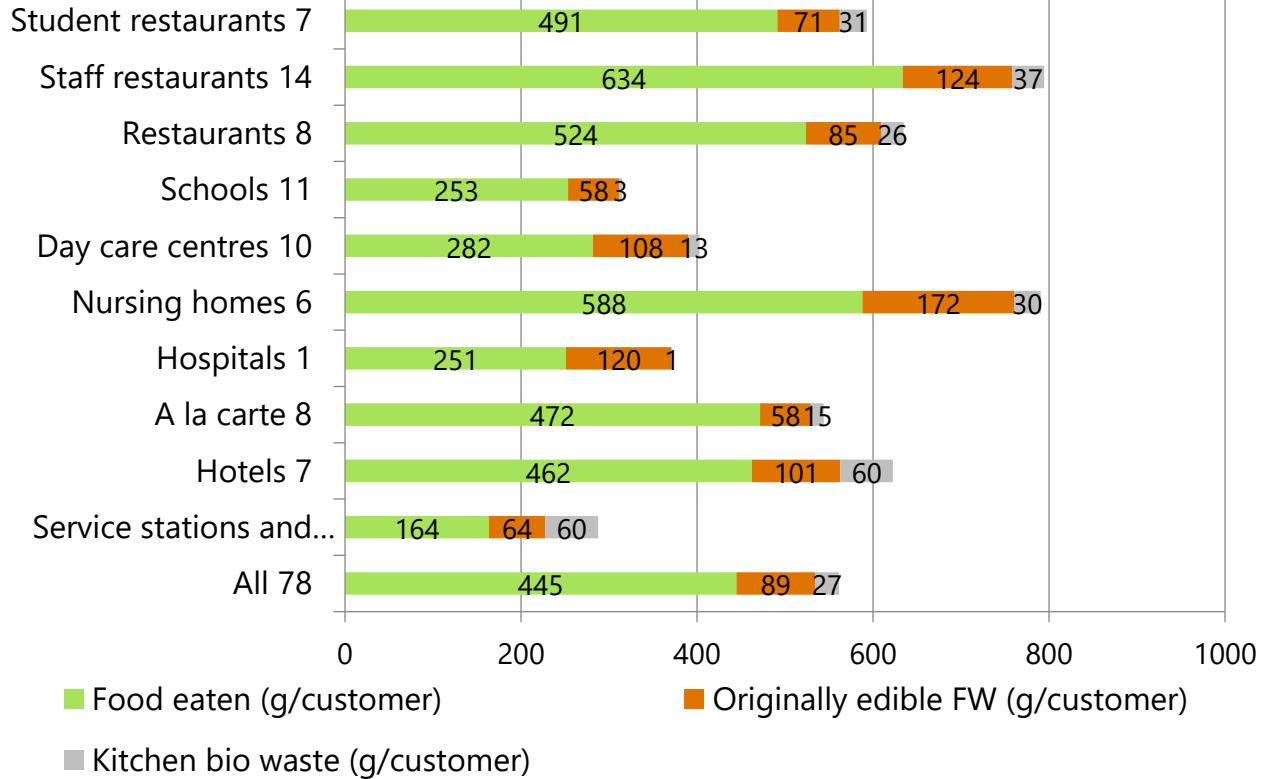

- To make daily measuring and logging easy, menus are imported to the application in advance. The monitoring system can be used in either buffet or a la carte restaurants and in outlets with both options.
- The application calculates both FW (originally edible and inedible) per kilogram of prepared food and FW per customer. The results can be used to evaluate what are the most significant sources of FW and what are the underlying reasons for it.

Food waste percentage

Food eaten, FW edible and inedible

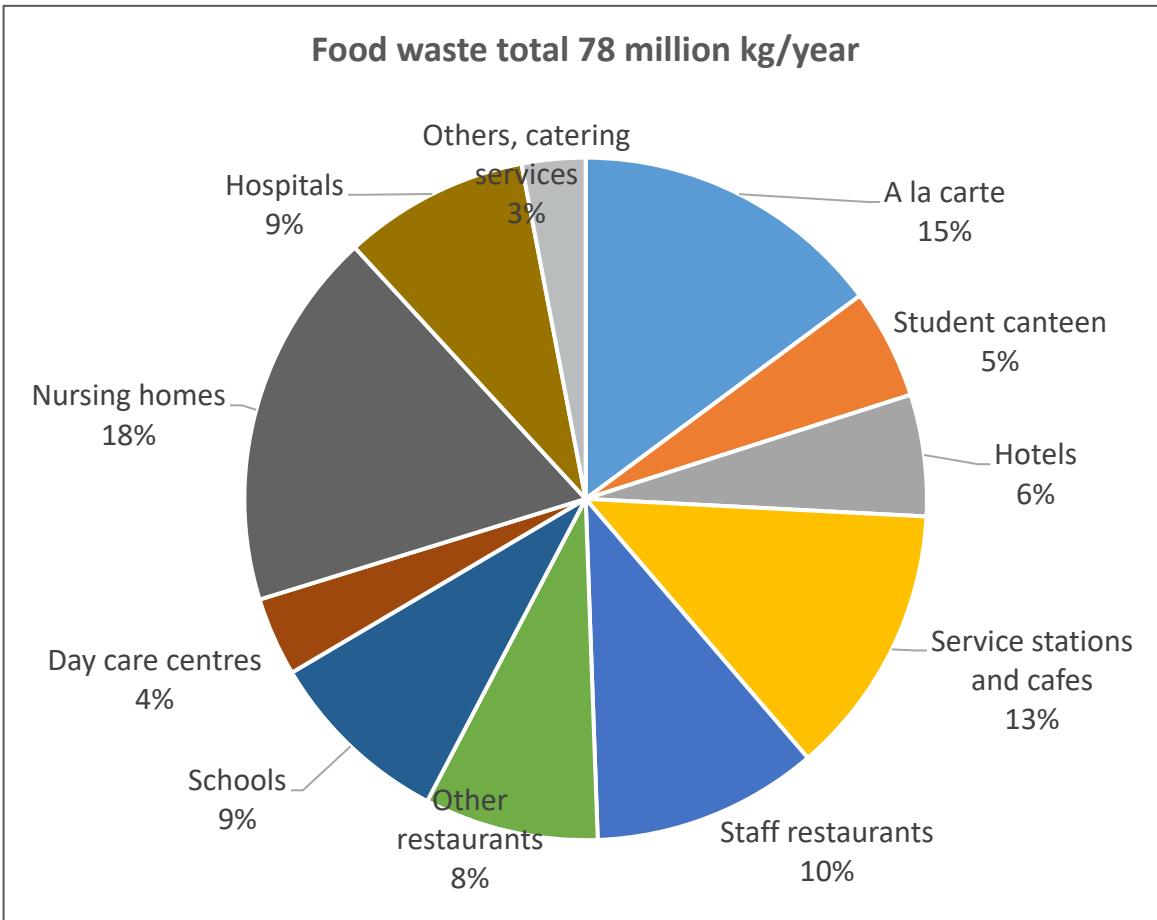

Silvennoinen, K., Nisonen, S. ja Lahti, L. 2019. Ravitsemispalveluiden elintarvikejäte : jätteen määärä 2018–2019 ja seurannan kehittäminen. Luonnonvara- ja biotalouden tutkimus 1/2020. Luonnonvarakeskus. Helsinki. 45 s.

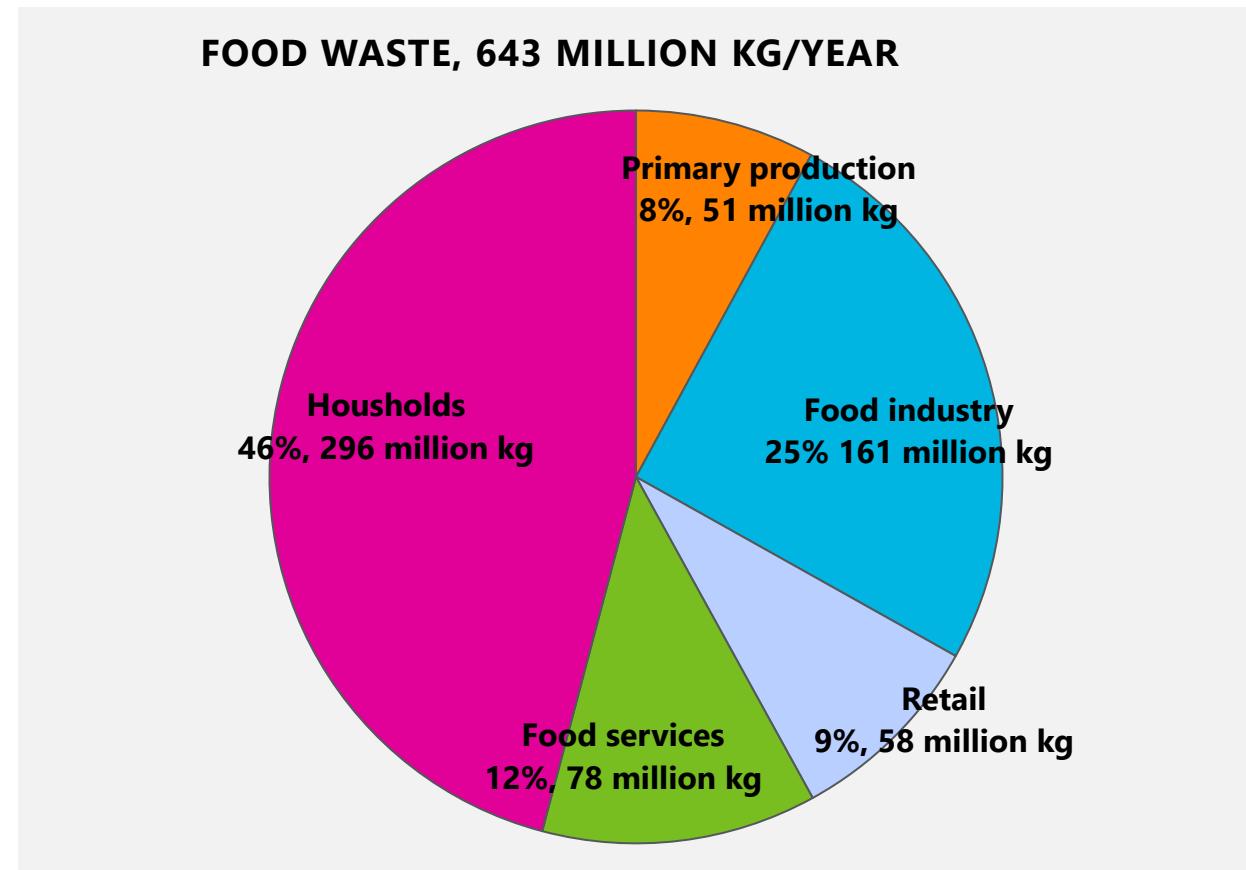

Total amount of FW in Finnish food service companies

- The total amount of FW was estimated by supplementing the FW measurement data with statistics on annual number of prepared portions in each category of food services
- The average amount of prepared food for each category in the sample was multiplied by the corresponding number of portions to get the amount of prepared food in Finland in kg/year
- This result was again multiplied by the average FW percentage in the sample to get the amount of FW for each category
- Results from each category were added together to get the total amount of FW in Finnish food services
- According to this estimation about 364 million kg of food was prepared in Finnish food services in 2019 and about 77 million kg of it ended up as FW (edible 61 million kg).
