ASF epidemiological situation for wild boars in Emilia-Romagna Region

As part of ASF surveillance activities in wild boar within the area concerned by ZR III, 107 samples were collected in 2025.

The sampled wild boar originated from:

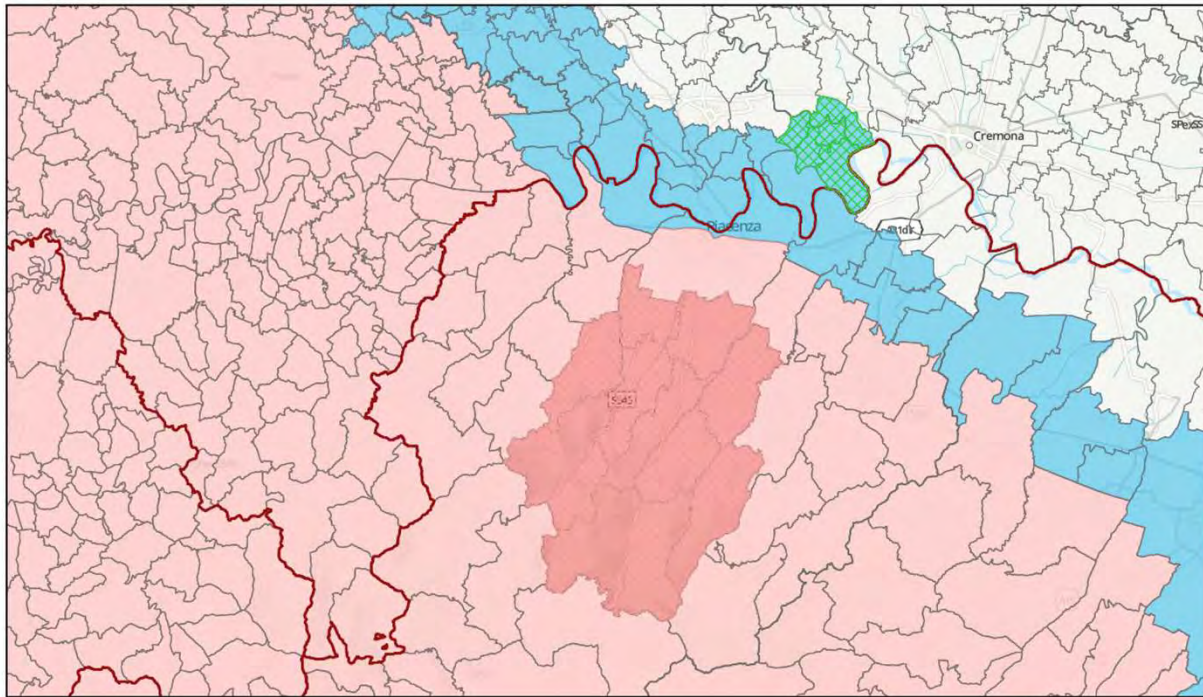

- carcasses found during active search activities (18 wild boar),
- carcasses found following public reports (8 wild boar),
- culling operations carried out for depopulation purposes (81 wild boar).

Of the 107 sampled wild boar, 97 tested negative, 2 were unsuitable for testing, and 8 tested positive for ASF.

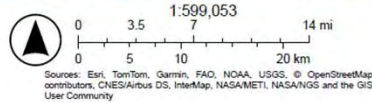

The 8 positive wild boar were detected in the following municipalities:

- Gazzola (1 wild boar)
- Vigolzone (3 wild boars)
- Ponte dell'Olio (2 wild boars)
- Gropparello (2 wild boars)

Proposal of reverting restriction zone 3 in restriction zone 2

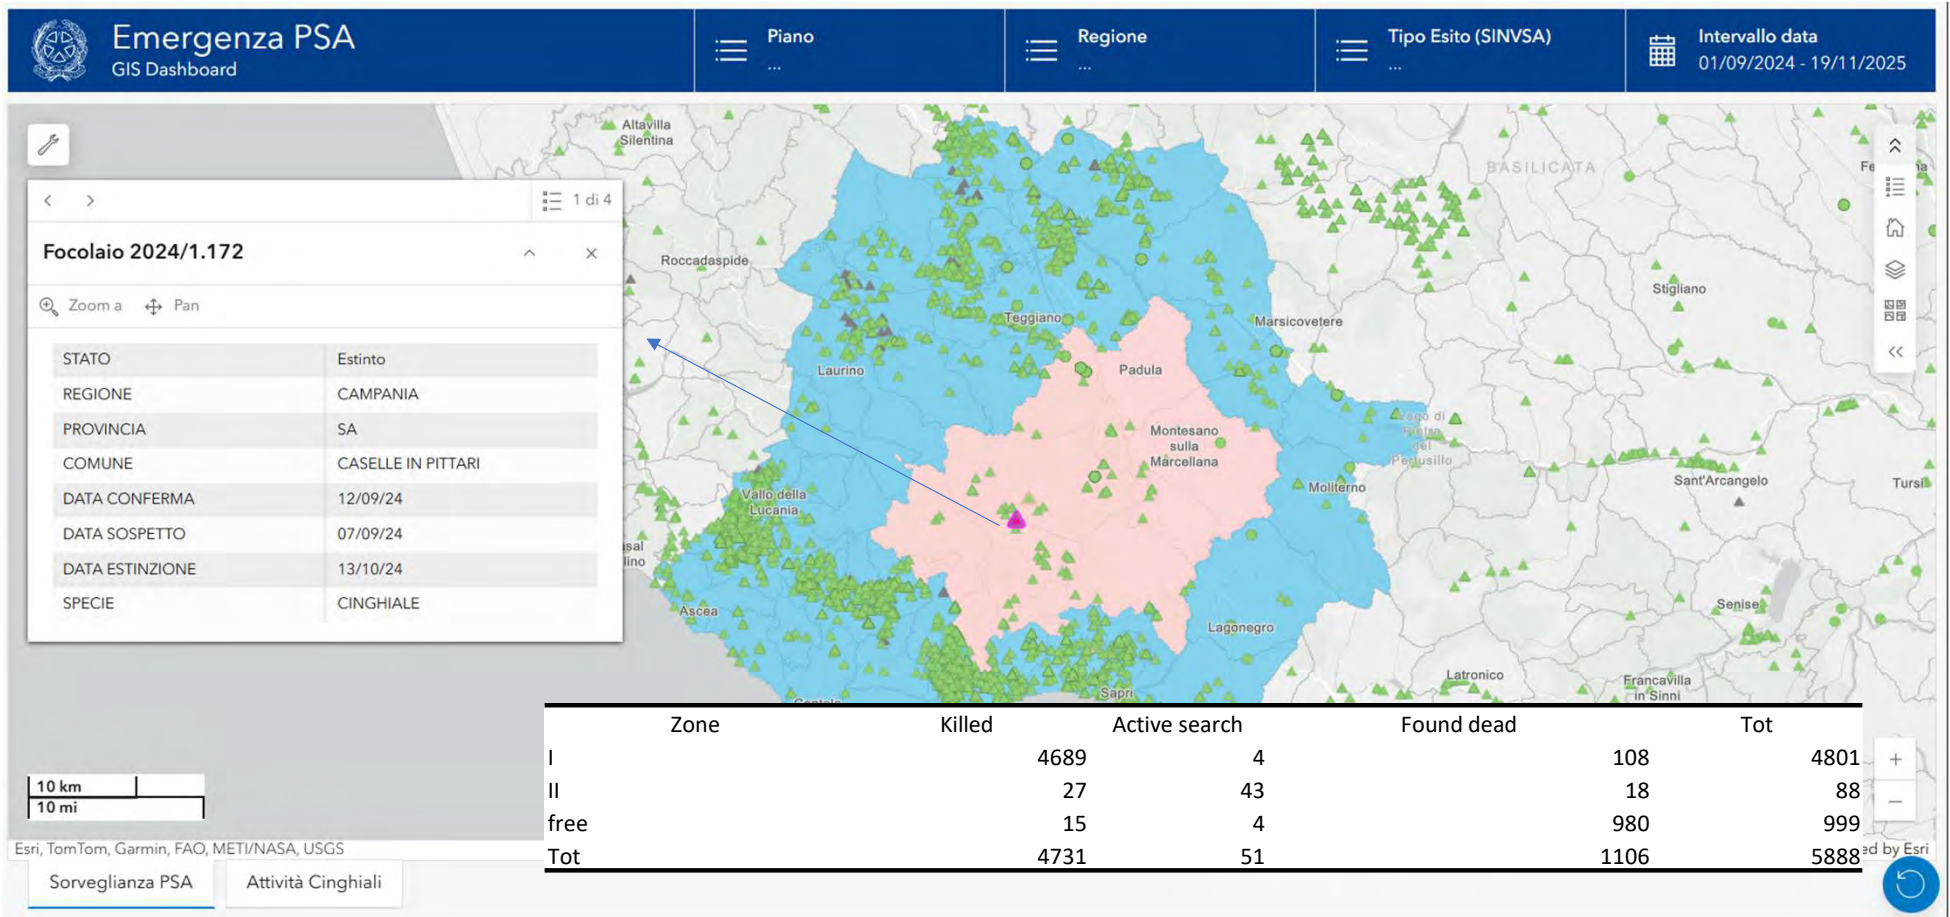

12/11/2025, 10:21:56

- low density of commercial farms and, in some cases, none at all (Travo and Gossolengo);
- passive surveillance and active search activities have detected a low number of wild boar. Most of the animals tested were negative, while only 8 positive samples were found, the most recent dated 11/05/2025;
- commercial pig farms apply the enhanced biosecurity measures set out in Regulation 594/2023, while farms that do not meet the required standards remain under official restrictions and prohibited from restocking;
- all backyard/family farms in the province of Piacenza currently have zero animals, with a prohibition on restocking.

Epidemiological situation in Campania (and Basilicata)

Active search of carcasses in Campania (and Basilicata)

* Arrotondamento per eccesso, tra parentesi il risultato del calcolo aritmetico.

The period assessed was between 01/08/2024 and 11/07/2025 for a total duration of more than 15 months. The most recent positive result was detected on 09/07/2024 and was recorded on a long-bone fragment whose thanatological investigations would link the remains to a wild boar that died during the epidemic wave of early June

Proposal revoking restricted zones in Campania (and Basilicata)
